Rand Water uses a Financial Tolerance Range in order to assess how reasonable the market response prices are. These ranges will assist with eliminating bid prices that are deemed to be excessively high or low to complete the works. The higher limit ensures that Rand Water does not pay more than it believes the value of service or goods is worth, and the lower limit ensures that Rand Water is not exposed to risk of work not being completed or prices increasing subsequent to the award because the award price was too low to complete said scope.

RECORDING OF WEATHER AND ABNORMAL RAINFALL

If during the time for completion of the works or any extension thereof abnormal rainfall or wet conditions shall occur then an extension of time in accordance hereof shall be granted by the Employer calculated in accordance with the formula given below for each calendar month or part thereof.

$$V = (Nw - Nn) + ((Rw - Rn)/X)$$

V	Extension of time in calendar days in respect of the calendar month under consideration.
Nw	Actual number of days during the calendar month on which a rainfall of Y mm or more has been recorded.
Nn	Average number of days, as derived from existing rainfall records, on which a rainfall of Y mm or more has been recorded for the calendar month.
Rw	Actual rainfall in mm recorded for the calendar month under consideration.
Rn	Average rainfall in mm for the calendar month as derived from existing rainfall records.

For purposes of the contract Nn, Rn, X and Y shall have those values assigned to them in the Contract Data and/or the Specification. The total extension of time shall be the algebraic sum of all monthly totals for the period under consideration, but if the total is negative the time for completion shall not be reduced due to subnormal rainfall. Extensions of time for part of a month to be calculated using pro rata values of Nn and Rn. This formula does not take account of flood damage that could cause further or concurrent delays and will be treated separately as far as extension of time is concerned.

The factor (Nw-Nn) shall be considered to represent a fair allowance for variations from the average number of days during which rainfall exceeds Y mm. 1. TECHNICAL SPECIFICATIONS

GABIONS

1

1.2. DEFINITION

A cage of galvanized steel wire mesh (with or without PVC coating) that is packed with stones and is used in retaining structures and in various applications to counter erosion. Gabions are made of hexagonal wire Mesh Type 80, commonly referred to as double twist wire mesh as per SANS 1580:2001. The panel edges are strengthened with a wire of a greater diameter than the mesh wire.

1.3. WIRE.

Steel wire, Mesh Type 80 to SABS 1580:2001, heavily zinc coated (250g/m²) to SABS 675:1993 of 2.7mm diameter, Class A Galvanized wire with a tensile strength between 350-575 N/mm² as per SANS 675:1997. The wire shall not be PVC coated.

1.4. FILLING, BRACING AND LACING

Sufficient lacing (binding) and connecting wire shall be supplied with the Gabions cages to complete all

the wiring operations that are necessary for the construction of all gabions.

Using adequate quantities of connecting and lacing (binding) wire, the Contractor shall

Complete the wiring in accordance with the manufacturer's instructions. The lacing together of the edges of adjoining boxes / mattresses and of diaphragms to side panels, and the lacing of lids shall be so carried out that, when the laced attachments are tested, the force required to separate the edges, the diaphragms and the lids is at least 1,5kN/m.

Particular care shall be exercised in filling against the faces of gabions that will be exposed to view in the finished structure. Selected rock particles of adequate size shall be so packed as to obtain a fair-faced finish. Successive gabions boxes shall be filled in stages, to prevent deformation and bulging. They shall be filled to just below the level of the wire braces (as above) and the braces shall then be twisted, windlass-style, to provide tension, after which the filling shall be completed, the boxes being slightly overfilled to provide for settlement. Care shall be taken to ensure that the lids of each course of gabions boxes are closed and laced before the next successive course of gabions boxes is placed, and that each box is filled evenly to a level surface ready to receive the next course of boxes. A true face shall be achieved when constructing gabions, preventing bulging of the front face by bracing.

1.5. GEOTEXTILES

1.5.1. DEFINITION

A material in the form of a sheet, a blanket or a net that is permeable to water and typically has a hydraulic conductivity of 1×10^{-5} m/s to 1 m/s as per SABS 1200DK-1984. Properties determined in accordance with SABS 0221:88

1.6. MATERIAL

A geotextile blanket shall be made of fibres consisting of at least 85% (by mass) of polypropylene, polyethylene, a polyester, a polyamide, or a co-polymer of vinyl chloride and vinylidene-chloride, or any combination of these polymers, and the polymer(s) shall contain such additives as are necessary to render the filaments resistant to the effects of ultraviolet radiation and heat. It shall be continuous double needle –punched filaments of minimum 9kN/m tensile strength. The Manager Environmental management services approval of the make and the grade of geotextile shall be obtained by the Contractor before the Contractor orders or uses any geotextile in the Works.

1.7. INSTALLATION

Where and as scheduled, geotextile that complies as already stated, as applicable, shall be placed beneath and on the sides of empty gabion and Reno mattress cages where it will not affect the flow of water. It shall be laid on the top of the prepared bottom or on the sides, or on both, of each excavation before the gabion cages are placed. A geotextile shall be placed either with an overlap of at least 300mm that is securely fastened to prevent any movement or slipping during the placing of gabion

cages and rock fill, or Provided that it is sewn or bonded in an approved manner, with an overlap of at least 75mm.

1.8. Trenching.

When trenching, only the specific area to be worked on must be excavated. No additional soil may be excavated. The mattresses and Reno mattress must fit in exactly into the excavated area.

1.9. Compaction

The excavated area around the Reno mattresses is to be compacted. Compaction will be done in a manner that obtains a 70-80% compaction (as the area on sides of Reno mattresses will be minimal and industrial compactors are not anticipated as part of the work).

1.10. ROCKS

Stone shall be clean, hard, un-weathered, and free from fissures and flaking. It shall have a relative density of at least 2.40 and when the stone is subjected to the weathering test, the loss of mass shall not exceed 5%. In the case of dolerites, when the stone is subjected to the durability test, the number of stones broken near their middle shall not exceed 5%. Generally angular or rounded river stone should be used and not flat stone. No stone shall be of such a size that it will pass through a ring of diameter 80mm, being the mesh diameter of the used gabion. No stone shall be of a size exceeding the maximum size of 200mm diameter.

And natural weathered rock shall be used in the face of the mattresses. No blasted rock shall be used on the outer surface/face.

1.11. Backfilling

- Cutting of soil over the pipe and put aside for using as topsoil of the berm. the area should be done so as to ensure good levelling of the area.
- Levelling should be done to promote vegetation colonization.
- Topsoil to be free of debris.
- Rubble material to be free of metals and hazardous chemicals.
- A sample of topsoil to be used to be shown to Environmentalist rehab before application.
- Compaction should be done in layers of 300mm of material applied.

2. Grass Blocks installation

- If the soil is dry, water the area thoroughly a day or two before you begin soil preparation.
- Identify off loading and loading points at site
- **Spacing:** Grass blocks need to be placed a minimum of 5mm apart, because lateral movement may cause the corners and leading edges to break.
- **Ground work:** Ground work needs to be properly prepared and compacted, there must be no uneven or high points that may cause the product to see-saw
- **Bedding sand:** To prevent the product from splitting in half the bedding sand must be the

correct depth. A bedding layer of at least 35mm that consists of river sand is advised to be used.

- **Edging:** Edge restraints are critical to ensure that the product does not start to slip laterally due to gravity and edges should be at the level as the surrounding natural level.
- **Jointing Material:** Compost and similar materials are not suitable jointing materials as they have no structural integrity. If compost is required, then it is advisable to fill all the joints and voids half way full with suitable jointing sand and then fill the top half with compost.
- **Backfilling of Concrete Grass Blocks with Topsoil**
Backfilling of concrete grass blocks must be carried out using clean, fertile topsoil that is free of debris, stones, roots, and other foreign materials that may impede grass growth. The topsoil should be well-graded and evenly spread into the voids of the concrete grass blocks to ensure full contact with the surrounding surfaces. Care must be taken to compact the soil lightly, avoiding over-compaction that could hinder root development. This process is essential to support healthy vegetation establishment and provide long-term surface stability.
- **Seeding**
Once the topsoil has been properly backfilled, seeding should be carried out using grass species that closely match those naturally present in the surrounding area. The selected seeds must be of high quality, free from contaminants, and appropriate for the local climate and soil conditions. The seeds are to be thoroughly mixed into the topsoil and evenly distributed across the backfilled surface. This ensures a uniform grass cover that blends seamlessly with the existing landscape, promotes quick germination, and reduces the risk of erosion.
