1. PURPOSE

The purpose of the project is to:

- 1.1 Determine the existence and accuracy of timber volume for standing trees and compartments in the commercial forestry plantations for the Department of Forestry, Fisheries and the Environment (DFFE).
- 1.2 Improve the accuracy of data used in the valuation of the biological assets for accurate disclosure in the Interim and Annual Financial Statements of the Department, and
- 1.3 Estimate financial returns to be made and to assist in operational, tactical and strategic plans.

2. INTRODUCTION AND BACKGROUND

- 2.1 Department of Forestry, Fisheries and the Environment has, over the years, not been conducting the stock enumeration of the whole population of trees. Therefore, the Department seeks to enumerate the population of trees within a forest and ascertain other information, such as their volume, value, growth and species composition in commercial forestry plantations.
- 2.2 The stock enumeration involves measuring a sample area in a forest stand as a representation of the entire population of that forest unit at a given time. The process of gathering the data for the sample can be complex and expensive.
- 2.3 The stock enumeration is a highly specialized operation to obtain the following current parameters from a compartment: diameter on breast height (dbh), stems per hectare (sph) and tree height. Future management decisions, plantation valuation and volume predictions are based on data that the enumeration teams collect. Therefore, it is imperative, that the enumeration teams deliver consistently accurate work. Accuracy (quality) of work, rather than quantity of work (productivity) will be a key measurement area. A properly trained team must thus be used for this purpose.
- 2.4 The DFFE currently manages the commercial forestry plantations that cover an area of approximately 110 733, 04 hectares (ha), which includes 64 505,35 ha of commercial forestry areas and 46 227, 69 ha of non-commercial forestry areas. These plantations are geographical distributed in five different Regions: KwaZulu-Natal (KZN); Eastern Cape (EC); Limpopo (LP); Mpumalanga (MP) and North West (NW). An additional estimated 22 000 ha are based in the Western Cape Province.

3. OBJECTIVES

- 3.1 To appoint a suitable service provider(s) to conduct the stock enumeration in the Department's commercial forestry plantations for a period of eighteen (18) months.
- 3.2 The stock enumeration requirements for the project will cover an area of approximately 12 926,9 ha in the Eastern Cape, KwaZulu-Natal and Limpopo.

4. SCOPE AND EXTENT OF WORK

4.1 Projected area to be enumerated per Province:

4.1.1 The appointed service provider(s) would be expected to conduct stock enumeration in three (3) provinces according to the type of enumeration specified on table 1 below.

Table 1: Estimated areas per province

Enumeration Type	Projected area to be enumerated per province		
	Eastern Cape	KwaZulu-Natal	Limpopo
Pre-clear fell enumeration	469,05 ha	3 799,99 ha	924,83 ha
Working plan enumeration	2 404,95 ha	4 768,54 ha	559,54 ha
Total	2 874,00 ha	8 568,53 ha	1 484,37 ha
***The hectares reflected above may vary due to factors such as land invasion, timber theft, fire damage, pest and disease, animal damage and changes in plantable land.			

- i) Pre-clear fell enumeration – an enumeration within one year of clear felling. The purpose is to provide accurate volumes and product volumes before clear felling.
- ii) Working plan enumeration – an enumeration at fixed five (05) year intervals in the life cycle of the compartment. The purpose is to provide data on a compartment's standing volume and data used for projecting future volumes.

4.1.2 The estimated areas to be enumerated per plantation are outlined in Table 2.

GRAND TOTAL		5 193,87	7 733,03	12 926,90

4.2 Sampling Method and Sampling Intensity

4.2.1 The prescribed sampling method is circular plot:

- i) 500m² plot radius = 12.62m for medium to low density populations (800 stems per hectare (sph) or less).
- ii) 300 m² plot radius = 9.77m for stands with a density higher than 800 sph.

4.2.2 The sampling intensity (sample size) depends mainly on compartment size and variability (species, site differences) of the growing stock in terms of DBH and sph to determine the number of plots required. The number of plots required should be determined using the sampling intensity outlined on Table 3:

Table 3: Sample size as a function of compartment area

Compt. Area (ha)	% Sample (Area)	Number of plots required per hectare	
		500 m ² plot	300 m ² plot
1-3	10 %	6	10
3-5	7.5 %	8	13
5-10	5.0 %	10	17
> 10	3.0 – 5.0 %	10-15	17

4.2.3 The plots must be evenly distributed and cover all part of the compartment. The standard distance from one plot to another is 100 metres (m). In a case where it is not practical to lay a standard distance, the team should determine a practical distance to use and record the reasons for deviation. This distance must also be recorded.

4.3 List of Equipment/ Tools

4.3.1 The enumeration equipment used in the DFFE is electronic equipment, which automatically captures all the data in an electronic format. The service provider(s) should provide their own set of electronic equipment and other enumeration tools required to conduct the stock enumeration to maintain compatibility with the current forestry planning system used by the Department. The use of electronic equipment also minimises errors and save data transfer time.
