CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

1. Introduction

Eskom Holdings SOC Limited supports government's commitment to waste management for ensuring the protection of health and the environment by providing reasonable measures for the prevention of pollution and ecological degradation. This is defined specifically in the National Waste Management Strategy (NWMS) of 2011, the National Environmental Management Act (NEMA), 1998 (Act 107 of 1998), and the National Environmental Management Waste Act (NEMWA), 2008 (Act 59 of 2008), as amended, and the regulations thereunder, not excluding other relevant environmental legislation and international agreements to which South Africa is a party.

The following principles and norms on waste management are internationally recognised and have been agreed upon at the Basel Convention. These principles and norms must be applied and considered by any person engaged in the handling, storage, collection, recycling, disposal and transportation of waste. Eskom Holdings SOC Limited adopts the seven environmental management principles in line with NEMA (Act 107 of 1998).

- a) **Duty of care** – Any generator of waste is responsible to ensure that the waste is handled, stored, collected, disposed of and transported in an environmentally sound manner. Waste must be avoided, minimised, reused, recycled or otherwise disposed of in a responsible manner. The generator of waste is responsible for the fate of the generated waste in all circumstances. The generator remains legally liable for any harm to humans, for damage to property or deterioration of the environment.
- b) **Cradle to grave** – Any generator of waste is legally responsible for its disposal from point of generation to final disposal. Responsibility for the waste and the considerations of the waste exist throughout its life cycle.
- c) **Polluter pays principle** – Any person causing pollution is responsible for any costs incurred in the cleaning and rehabilitation of the impact on the environment.
- d) **Precautionary principle** – Prevention of harm is the best method of environmental protection, and when knowledge is limited, applies as the precautionary approach. Always assume that waste is hazardous until it is shown to be safe. Take action to avoid the possibility of irreversible environmental harm.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

- e) **Preventative principle** – Reduce risk by ensuring that collection, treatment and disposal takes place as near as possible to the point of generation as is technically and environmentally feasible.
- f) **Proximity principle** – The treatment and disposal of general and hazardous waste should take place as near as possible to the point of production, in order to minimise transportation and environmental risks. Waste should be managed and disposed of as close to the point of generation as possible. The objective is to minimise transport distances and cost, exposure and risk associated with waste.
- g) **Promote waste minimisation, reuse, recycling and recovery of waste principle** – Focus on implementing the waste management hierarchy with the ultimate aim of diverting waste from landfill sites.

This Standard is necessary to provide the minimum management requirements of waste streams and to ensure legal compliance.

2. Supporting clauses

2.1 Scope

The scope of this document covers the minimum requirements that must be adhered to for the management of the waste streams that can pose a significant risk to Eskom Holdings SOC Limited. It therefore does not relieve employees in any way from any of their legal responsibilities in respect of environmentally sound management of all other waste streams resulting from business activities not addressed in this Standard.

2.2 Purpose

This Standard aims to provide the minimum management requirements for waste that can pose a significant risk to environment and health.

2.3 Applicability

This document shall apply throughout Eskom Holdings SOC Limited and subsidiaries.

2.4 Effective date

This Standard will be effective from date of authorisation.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

2.8 Definitions

- 2.8.1. Asbestos-containing material** means asbestos as well as any material that contains asbestos and includes asbestos cement products, asbestos coating, asbestos insulation board, asbestos insulation, asbestos textured decorative coatings, asbestos contaminated soil and other asbestos-containing materials.
- 2.8.2. Business waste** means waste that emanates from premises that are used wholly or mainly for commercial, retail, wholesale, entertainment or government administration purposes.
- 2.8.3. Building and demolition waste** means waste, excluding hazardous waste, produced during the construction, alteration, repair or demolition of any structure, and includes rubble, earth, rock and wood displaced during that construction, alteration, repair or demolition.
- 2.8.4. Colour coding** means the use of colour on a container or bag or the label attached to such, that serves to identify the category of waste that it contains.
- 2.8.5. Contaminant** means any substance present in an environmental medium at concentrations in excess of natural background concentrations that has a potential to cause harm to human health or the environment.
- 2.8.6. Disposal** means the burial, deposit, discharge, abandoning, dumping, placing or release of any waste into, or onto, any land.
- 2.8.7. Domestic waste** means waste, excluding hazardous waste, that emanates from premises that are used wholly or mainly for residential, educational, health care, sport or recreation purposes.
- 2.8.8. General waste** means waste that does not pose an immediate hazard or threat to health or to the environment, and includes—
- a) *domestic waste;*
 - b) *building and demolition waste;*
 - c) *business waste;*
 - d) *inert waste; or*

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

e) *any waste classified as non-hazardous waste in terms of the regulations made under Section 69 of NEMWA and includes non-hazardous substances, materials or objects within business, domestic, inert, building and demolition wastes.*

2.8.9. General waste storage facility means a storage facility that has a capacity to store in excess of 100 m³ of general waste continuously.

2.8.10. Hazardous waste means any waste that contains organic or inorganic elements or compounds that may, owing to the inherent physical, chemical or toxicological characteristics of that waste, have a detrimental impact on health and the environment and includes hazardous substances, materials or objects within business waste, residue deposits and residue stockpiles.

2.8.11. Hazardous waste storage facility means a storage facility that has a capacity to store in excess of 80 m³ of hazardous waste continuously.

2.8.12. Health care general waste means the non-hazardous portion of the waste generated at a health care facility. This is any waste that comprises uncontaminated plastics, paper, flowers, cardboards or food residues.

2.8.13. Health care risk waste means the hazardous portion of the waste generated at a health care facility. This is any waste that poses a hazard to human health or the environment.

2.8.14. PCB-contaminated material means oil or articles with a PCB concentration greater than 51 mg/kg but less than 500 mg/kg.

2.8.15. PCB material means oil or articles with a PCB concentration greater than 500 mg/kg.

2.8.16. PCB waste means waste as defined in the National Environmental Management: Waste Act, 2008 (Act 59 of 2008), which contains PCB materials or PCB-contaminated materials; and "SANS 290" means the latest edition of the South African National Standards for mineral insulating oils management of polychlorinated biphenyls (PCBs).

2.8.17. Recycle means a process where waste is reclaimed for further use, which process involves the separation of waste from a waste stream for further use and the processing of that separated material as a product or raw material.

2.8.18. Remediation means the management of a contaminated site to prevent, minimise or mitigate harm to human health or the environment.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

2.8.19. Reuse means to utilise the whole, a portion of or a specific part of any substance, material or object from the waste stream for a similar or different purpose without changing the form or properties of such substance, material or object.

2.8.20. SANS 10234 means the latest edition of the South African National Standard Globally Harmonised System of Classification and Labelling of Chemicals.

2.8.21. Temporary storage means a once-off storage of waste for a period not exceeding 90 days.

2.8.22. Waste means

- a) any substance, material or object that is unwanted, rejected, abandoned, discarded or disposed of, or that is intended or required to be discarded or disposed of, by the holder of that substance, material or object, whether or not such substance, material or object can be reused, recycled or recovered and includes all wastes as defined in Schedule 3 to the Act (NEMWA, 2014); or
- b) any other substance, material or object that is not included in Schedule 3 that may be defined as a waste by the Minister by notice in the Gazette, but any waste or portion of waste, referred to in paragraphs (a) and (b), ceases to be a waste—
 - (i). *once an application for its reuse, recycling or recovery has been approved or, after such approval, once it is, or has been, reused, recycled or recovered;*
 - (ii). *where approval is not required, once a waste is, or has been reused, recycled or recovered; or*
 - (iii). *where the Minister has, in terms of Section 74 of NEMWA, exempted any waste or a portion of waste generated by a particular process from the definition of waste; or where the Minister has, in the prescribed manner, excluded any waste stream or a portion of a waste stream from the definition of waste.*

2.8.23. Waste-disposal facility means any site or premise used for the accumulation of waste with the purpose of disposing of that waste at that site or on that premise.

2.8.24. Waste facility means a commercial place, infrastructure or containment of any kind including associated structures or infrastructure where there is sorting, shredding, grinding, crushing, screening, chipping or baling of general waste.

2.8.25. Waste transfer facility means a facility that is used to accumulate and temporarily store waste before it is transported to a recycling, treatment or waste-disposal facility.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

2.8.26. Waste classification means establishing, in terms of SANS 10234

- a) whether a waste is hazardous based on the nature of its physical, health and environmental hazardous properties (hazard classes); and
- b) the degree or severity of hazard posed (hazard categories).

2.8.27. Waste generator means any person whose actions, production processes or activities, including waste management activities, results in generation of waste.

2.8.28. Waste manager means any person that reuses, recycles, recovers, treats or disposes of waste.

2.8.29. Waste transporter means any person who conveys or transfers waste between the waste generator and a waste management facility; or between waste management facilities.

2.8.30. Waste manifest system means a system of control documentation, which accompanies a load of hazardous waste transported from the point of generation to the waste management facility.

2.9 Abbreviations

Abbreviation	Explanation
ACM	Asbestos-Containing Material
ACW	Asbestos-Containing Wastes
CCP	Coal Combustion Products
CoE	Centre of Excellence
CFL	Compact Fluorescent Lamps
ESC	Environmental Steering Committee
FGD	Fluidised Gas Desulphurisation
GG	Government Gazette
GN	Government Notice
HCW	Health Care Waste
HCGW	Health Care General Waste
HCRW	Health Care Risk Waste
ISO	International Organisation of Standards
ODS	Ozone-Depleting Substances

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

Abbreviation	Explanation
PCB	Polychlorinated Biphenyl
POPs	Persistent Organic Pollutants
SANS	South African National Standard
SAWIS	South African Waste Information System
SOC	State-owned company

2.10 Roles and responsibilities

- The Waste Centre of Excellence (CoE) is responsible for the development and monitoring the implementation of this Standard.
- The Business Units and Operating Units are responsible for implementation of this Standard.

2.11 Process for monitoring

The processes as set out in this Standard shall be subjected to audits as undertaken by the Business Units, Operating Units and Waste CoE for verification of data and adherence to standard and work instructions, internal audits by processes employed by Assurance and Forensics and external audits as required for assurance purposes.

2.12 Related/Supporting documents

[1] Waste reporting template: 240-47176064

[2] PCB inventory template: 240-51752992

[3] Hydrocarbon spill assessment table: 240-47176039

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

3. Document content

Waste management comprises the full range of activities that accompany custodianship and disposition of waste from the point of generation to the point of final disposal. It embraces all aspects of waste management hierarchy (waste minimisation, reuse, reduce, recycle and recover), storage, treatment, transportation and its disposal. The requirements below contain specific extractions from the Act as areas where special attention need to be given to within Eskom Divisions and Business Units or Operating Units. This does not relieve the reader of this document from the legal obligations under the omitted sections and complying with the new legislation that comes into effect after the publication of this Standard.

3.1 Waste management minimum requirements

Waste management in Eskom shall be managed according to this Waste Management Standard and other applicable documents. Waste management practices of waste streams that can pose a significant risk shall be at least according to the processes described within the Appendices contained in this Standard. Divisions must ensure that their waste is reused, recycled, recovered, treated or disposed of within 18 months of generation. Personnel involved in waste management must be appropriately trained in all aspects of waste management. Only trained persons must be allowed to handle hazardous waste.

3.1.1 Waste generation

- a) All employees, including visitors, contractors, and suppliers doing work on behalf of the organisation on its premises, are considered as generators of waste in terms of this Standard. Therefore, it is the responsibility of each generator to identify any general or hazardous wastes that he or she might be producing and to ensure the waste is handled in a manner consistent with the Waste Management Standard requirements listed in this document.
- b) Waste generators must have processes in place that are designed and operated to prevent, or minimise, the quantities of waste generated and hazards associated with the waste generated.
- c) Waste generators must ensure that substituting of raw materials or inputs have less hazardous or toxic materials, or with those where processing generates lower waste volumes.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

- d) Waste generators must institute good housekeeping and operating practices, including inventory control, to reduce the amount of waste resulting from materials that are out of date, off specification, contaminated, damaged, or excess to plant needs.
- e) Waste generators must institute procurement measures that recognise opportunities to return usable materials, such as containers, and that prevents the overordering of materials.
- f) Waste generators must ensure minimisation of hazardous waste generation by implementing stringent waste segregation to prevent the mixing of non-hazardous and hazardous waste to be managed.
- g) Waste generators must ensure their waste is classified within 180 days of generation based on physical, health and environmental hazards SANS 10234 "Globally Harmonised System of classification and labelling of chemicals" (GHS).

3.1.2 Waste storage of general and hazardous waste excluding health care risk waste

Waste storage refers to the storage of waste on Eskom sites while awaiting disposal. This section covers the minimum requirements for storage of general and hazardous waste but excludes medical waste. Health care risk waste (HCRW) shall be managed in accordance to Appendix G of this Standard. The following are the requirements for waste storage:

- a) A waste storage facility must be registered with the competent authority prior to the construction taking place.
- b) These facilities are required to comply with the norms and standards without a need to conduct a basic assessment (BA) and obtain a waste management licence as required by Government Notice No. 921 of 29 November 2013.
- c) A waste storage facility must be located in such a manner that it can provide optimum handling and transportation of waste material.
- d) All waste storage facilities must be located in areas accessible by emergency response personnel and equipment.
- e) The waste storage facilities must be constructed and developed under the supervision of a registered professional engineer and must be in accordance with the approved civil engineering designs.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

- f) All the Business/Operating Units must have a documented labelling or colour coding system to designate different types of waste.
- g) Waste must be sorted at the source into various categories, and a documented procedure must be implemented to prevent any mixing of hazardous and general waste.
- h) Every waste handler must comply with Section 16 and 17 of the National Environmental Management: Waste Act, 2008 (Act 59 of 2008) in terms of measures to be taken in terms of general duty of care and waste minimisation, reduction, reuse, recycling and recovery.
- i) Nuisances such as odour, visual impacts and breeding of vectors must be prevented from developing.
- j) Training must be provided continuously as determined by the Business/Operating Units to all employees working with waste and to all contract workers that might be exposed to the waste.
- k) A waste storage facility must have effective access control to prevent unauthorised entry.
- l) Each waste storage facility must be able to provide documentation verifying the number of waste storage containers or tanks within the facility, date of collection and authorised collector/s and proposed final point of treatment, recycling or disposal.
- m) General waste storage facility that has a capacity to store in excess of 100 m³ of general waste must be registered with the authority in accordance with the national norms and standards for the storage of waste, Government Notice 926 of 29 November 2013.
- n) Hazardous waste storage facility that has a capacity to store in excess of 80 m³ of hazardous waste must be registered with the authority in accordance with the national norms and standards for the storage of waste, Government Notice 926 of 29 November 2013
- o) A new and existing facility for sorting, shredding, grinding, crushing, screening or baling of general waste must be registered with the competent authority in accordance with the national norms and standards for the sorting, shredding, grinding, crushing, screening or baling of general waste, Government Notice 1093 of 11 October 2017.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

- p) A waste facility that is already registered in terms of the national norms and standards for storage of waste and is sorting, shredding, grinding, crushing, screening or baling general waste must not reregister, but must comply with the national norms and standards for the sorting, shredding, grinding, crushing, screening or baling of general waste.

3.1.2.1 Waste containers

- a) Any container or storage impoundment holding waste must be labelled, or where labelling is not possible, records must be kept reflecting the following:
- the date on which the waste was first placed in the container;
 - the date on which the waste was placed in the container for the last time when the container was filled, closed, sealed or covered;
 - the date when, and quantities of, waste added and waste removed from containers or storage impoundment, if relevant;
 - the specific category or categories of waste in the container or storage impoundment as identified in terms of the National Information System, 2012; and
 - the classification of waste in terms of Regulation 4 once it has been completed.
- b) The containers in which waste is stored must be intact and not corroded or in any other way rendered unfit for the safe storage of waste.
- c) Adequate measures must be in place to prevent accidental spillage, or leakage, and in the case of an incident, adequate mitigation measures are in place to mitigate and to prevent reoccurrence of the incident.
- d) Skips/bins must be closed to prevent the waste from being blown away or rain entering and increasing the volume of waste.

3.1.2.2 Liquid and hazardous waste – specific requirements

- a) Liquid and hazardous waste storage areas must have firm, impermeable and chemical-resistant floors and a roof or should be a container that is coated to prevent direct sunlight and rainwater from coming into contact with the waste.
- b) A liquid waste storage facility must have an interception trench with a sump for intercepting and recovering potential spills.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

- c) The liquid waste storage area must have a secondary containment system (for example, bund, drip tray) of sufficient capacity to contain at least 110% of the maximum contents of the storage facility.
- d) Access to the hazardous waste storage facility must be limited to employees who have been trained with respect to operation of the hazardous waste storage facility.
- e) Hazardous waste must be stored in covered containers and only be open when waste is added or emptied.
- f) Fluorescent light bulbs must be stored in containers that prevent them from breaking, such as in their original boxes, boxes from replacement bulbs or containers supplied by fluorescent light bulb recyclers.
- g) Only persons who have been trained on precautionary measures that need to be taken, procedures that need to be applied at any particular type of work, procedures for dealing with spillages, appropriate use of protective clothing and the risk of hazardous substances to their health that they are likely to be exposed to must be allowed to handle hazardous waste.

3.1.3 Waste collection/transportation

- a) No person may import waste or transit waste through South Africa without complying with legislation or multilateral environmental agreements required for that transboundary movement of waste.
- b) The transportation of waste shall comply with all requirements as specified in the National Road Traffic Act, 1996 (Act 93 of 1996), including the associated SANS 10206, 10228, 10229, 10230, 10231, 10232 and 10406 Codes of Practice.
- c) Waste contractors transporting hazardous waste will be required to provide Eskom with the necessary documents as mandated by the Department of Transport under the National Road Traffic Act, 2006 (Act 93 of 2006), NEMWA, regulations and applicable by-laws to prove that they are permitted to handle and transport the waste and present a certificate of safe disposal.
- d) Any person engaged in the transportation of waste must take all reasonable steps to prevent any spillage of waste or littering from a vehicle used to transport waste.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

- e) Collection vehicles used for the collection and transportation of waste must not be used for any other purpose while collecting and transporting waste.
- f) Waste must be collected and transported in closed vehicles (covered to ensure that there is no windblown litter generation) during transportation where applicable.
- g) Waste transporters must be registered to do so with the national, provincial or municipal governments where applicable. A registration certificate must be provided as evidence.
- h) The waste generator (Eskom or any person working on behalf of Eskom) must provide the transporter with the relevant transportation documentation (as mentioned under normative references) for the consignment.
- i) The load must be properly loaded and secured on site prior to transportation.
- j) The transport operator of hazardous waste must have hazchem placards on his vehicle and ensure that they are properly fitted to the vehicle.
- k) The responsible person must ensure that before the vehicle leaves the consignor's premises it is not overloaded or showing any obvious defect that would affect its safety.
- l) The waste generator or his representative, that is, the transporter, must ensure that adequate steps are taken to minimise the effect an accident or incident may have on the public and on the environment.
- m) Where waste is transported for the purpose of disposal, a person transporting waste must ensure that the facility to which waste is transported is authorised to accept such waste.
- n) The waste generator (Eskom or any person working on behalf of Eskom) must provide the transporter with accurate information about the nature and properties of the load. Where contractors are used, the onus lies on the waste generator to ensure that the required information is correctly filled out on the waste manifest.
- o) All waste contractors will be required to provide Eskom with a waste manifest detailing the transportation type of waste disposed of, the quantities disposed of and how and where the waste was disposed of and a certificate of safe disposal.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

3.1.3.1 Waste manifest

Divisions must ensure that they are in possession of waste manifest documents of all waste that has been classified as hazardous. Information specified in item 2 of the waste classification and management regulation, Government Notice 634 of 23 August 2013 Annexure 2 must be reflected in the waste manifest document. All waste manifests must contain information supplied by the waste generator (consignor), information supplied by the waste transporter and information to be supplied by the waste manager (consignee).

3.1.4 Waste classification

- a) In order to determine the prescribed requirements for the disposal of landfill for industrial waste, all potentially hazardous industrial waste must be classified in accordance with the Waste Classification and Management Regulations: GN R 634 of 23 August 2013.
- b) In terms of this section, all waste generators must ensure that the waste they generate is classified in accordance with SANS 10234 (except if the waste is listed in Annexure 1 of this Regulation). The waste must be classified within 180 days of generation. This section requires compliance with SANS 10234. Refer to Appendix O for Waste Classification and Management.

3.1.5 Waste minimisation, recycling, reuse and recovery

- a) Divisions must take all reasonable measures to ensure to avoid the generation of waste, and, where such generation cannot be avoided, to minimise the toxicity and amounts of waste that are generated; reduce, reuse, recycle and recover waste. Refer to Appendix N on waste management hierarchy and waste minimisation.
- b) Waste must be managed in such a manner that it does not endanger health or the environment or cause a nuisance through noise, odour or visual impacts.
- c) Any Business/Operating Unit that sells a product that may be used by the public and that is likely to result in the generation of hazardous waste must take reasonable steps to inform the public of the impact of that waste on health and the environment.
- d) Waste produced from solar PV products is similar to that of e-waste, because manufacturing of PV semiconductor materials is similar to or based on microelectronics. PV recycling can be done either at integrated e-waste recycling facilities or lead-acid battery recycling centres.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

3.1.6 Waste disposal

- a) Waste shall be disposed of at facilities authorised to accept such waste. This also includes Eskom-owned waste facilities
- b) No burning of waste should occur at the general waste disposal facility nor any residential and business premises except at an approved and permitted incinerator.
- c) All general waste must be disposed at a designated, licensed landfill or waste disposal site or allowed transfer station in the local council or municipality.
- d) Pollution of the environment and harm to health must be prevented by not
 - disposing of waste or permitting waste to be disposed of on any land, body of water or at any unlicensed facility;
 - throwing, dropping, depositing, spilling or in any other way discarding any litter into or onto any public place, land, vacant erf, stream, watercourse, street or road, or on any place to which the general public has access, except in a container or a place specifically provided for such disposal;
 - disposing of waste in a manner that is likely to cause pollution of the environment or harm to health and well-being (for example, the burning or burying of waste);
 - disposing of unclassified waste; and not
 - using unlicensed/unpermitted waste disposal facilities for Eskom waste.
- e) Ensure that safe disposal certificates are retained for hazardous wastes that have been disposed of.

3.1.6 Waste reporting

- a) At a minimum, a waste register including the waste types, waste produced, quantities disposed of, quantities recycled, disposal destinations and safe disposal certificates, income, cost for handling, transportation or disposal must be kept.
- b) Records of waste must be maintained in accordance with applicable legislation (refer to Appendix J).
- c) To ensure waste management activities in Eskom are undertaken in a controlled manner, practices and resources shall be in place. Each Business/Operating Unit is required to compile a waste management plan in accordance to the requirements stipulated in Appendix A.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

- d) Waste management activities will be reported on within the organisation on a six-monthly and annual basis. Business/Operating Units should do waste reporting in accordance with the waste reporting template (240-47176064).
- e) Waste reporting, in accordance with South African Waste Information System (SAWIS), will be done by the Waste CoE to the Department of Environmental Affairs in a quarterly basis.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

Health care risk waste storage

- a) HCRW storage areas shall be clearly demarcated for the storage of HCRW and shall be clearly marked “health care risk waste storage area”.
- b) The storage area shall be large enough to accommodate the quantities of waste likely to be stored before collection.
- c) The storage area shall have a hard-standing surface and be easy to clean.
- d) The floors of the storage facility must be cleaned and disinfected and a register kept.
- e) The waste shall not be stored near patients or the food preparation area.
- f) Sharps must be contained in rigid, puncture-proof, tamper-proof and clearly marked containers.
- g) A plastic bag used as a liner in a disposable container or a reusable container shall have a thickness of not less than 60 µm.
- h) A waste generator must store HCRW other than pathological waste, sharps and pharmaceutical waste for not more than 90 days from the date of generation.

4. Acceptance

Appendix A: Industry waste management plans (IndWMP)**A.1 Industry waste management plans shall be developed and implemented to meet the requirements for these general duties in respect of waste management**

- a) Avoid the generation of waste. Where such generation cannot be avoided, minimise the toxicity and amounts of waste that are generated;
- b) Identify all waste streams that arise from the activities of the business;
- c) Reduce, reuse, recycle and recover waste as a first priority before disposal;
- d) Where waste must be disposed of, ensure that the waste is pre-treated and disposed of in an environmentally sound manner by the waste facility;
- e) Manage the waste in such a manner that it does not endanger health or the environment or cause a nuisance through noise, odour or visual impacts;
- f) Prevent any employee or person from contravening applicable environmental legislation; and
- g) Take reasonable measures to prevent the waste from being used for unauthorised purposes.

A.2 The industry waste management plans will at minimum contain the following:

- a) the amount of waste that is generated;
- b) measures to prevent pollution or ecological degradation;
- c) targets for waste minimisation through waste reduction, reuse, recycling and recovery;
- d) measures or programmes to minimise the generation of waste and the final disposal of waste;
- e) measures or actions to be taken to manage waste;
- f) the phasing out plans of the use of specified substances (for example, persistent organic pollutants, such as PCB, asbestos, ODS);
- g) opportunities for the reduction of waste generation through changes to packaging, product design or production processes;
- h) mechanisms for informing the public of the impact of the waste-generating products or packaging on the environment;
- i) the extent of any financial contribution to be made to support consumer-based waste reduction programmes;
- j) the period that is required for implementation of the waste management plan;
- k) methods for monitoring and reporting;
- l) the waste class and rating in order to determine the correct disposal method for the waste; and
- m) any other best practice that may be necessary to give effect to the requirements of NEM: WA and regulations passed thereunder.

Appendix B: Coal combustion products

Coal combustion products (CCP) are the collective term for all residues arising from the combustion of fossil fuels. This includes products from the boiler itself as well as the air pollution abatement equipment installed. An array of such products, each with its unique characteristics, have evolved over the past 40 years as power utilities adapted their technology to comply with legislation introduced to ameliorate the impact of coal combustion. Included among these are fly ash, bottom ash, various types of flue gas desulphurisation products like gypsum, ammoniated fly ash, high carbon fly ash from low NO_x burners and Hg capture, fluidised bed combustion residue, etc. Currently, Eskom CCPs are entirely fly ash and bottom ash. The flue gas desulphurisation technology to be employed at the new build power stations such as Kusile and Medupi will add gypsum to the list of CCPs.

B.1. Ash

A modern coal-fired power station with a total output of 3 600 MW will consume approximately 50 000 tons of coal every day. Depending on the coal quality, the calorific value (heat content) and ash content, stations can produce approximately 17 000 tons of ash per day. Almost 90% of the ash produced in the generation process is called fly ash or pulverised fuel ash. The reason for this is that the coal is pulverised into a very fine dust before being fed into the boilers to ensure efficient combustion. Larger particles of ash, called coarse ash, that make up the rest of the ash produced at the power station, drop down from the furnace and collect at the bottom in the ash hopper of the boiler.

Approximately 1, 2 million tons of ash per year is sold to, among others, the cement industry, where the ash is used as a cement extender. The ash consists of very fine, spherical particles and has almost zero carbon content, high pozzolanic activity (or reactivity) and unusually high consistency. Fly ash is successfully used to enhance the quality and economy of concrete. Uses of fly ash include brick making and dam building. It is also used as a cement extender during the manufacturing of cement. Approximately 250 000 tons of ash from Lethabo Power Station, for instance, was exported to Lesotho for the Katse Dam project. What fly ash Eskom does not sell on site is stored in ash dumps or dams that are controlled via the lining of trenches, monitoring of groundwater and rehabilitation of topsoil, but there is a risk of pollution.

CONTROLLED DISCLOSURE

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

B.2 Gypsum

The potential requirement to adhere to more stringent limits on the gaseous emission necessitates the removal of SO_x (oxides of sulphur) from flue gases during coal combustion. Subsequently, all new stations will include flue gas desulphurisation technology. This technology requires the introduction of a sorbent (usually limestone or dolomite) to reduce the amount of SO₂ that is emitted. Calcium from the limestone reacts with the SO₂ to form calcium sulphite or calcium sulphate and CO₂. A by-product of the FGD process is gypsum. Gypsum has a commercial value and could be sold on the market. Demand for such a product is currently being determined by the supply chain operations (Commercial Department).

A study has been initiated to investigate the potential opportunities that will result in the use of this resource. Initial findings indicate that construction and agriculture are the most suitable sectors for gypsum commercialisation. It can be used for the manufacture of wallboard, plaster and screeds, set retarder for Portland cement and for soil stabilisation. However, the use depends on the nature, composition and the properties of gypsum.

Eskom will continue to engage with industry to promote the use of CCPs and set internal targets to encourage additional uses. This will be done in conjunction with the current key role players in the market and will take into consideration Eskom's strategy around supplier development and localisation with the specific focus on black woman-owned (BWO) companies.

B.3 Legislative requirements

The Regulations under the ECA as published in GN 1986 in GG 12703 of 24 August 1990 and as amended by GN 292 in GG 24938 of 28 February 2003 expressly exempted ash produced by or resulting from activities at an undertaking for the generation of electricity under the provisions of the Electricity Act 41 of 1987 as being classified as waste. There was thus no obligation for power stations to obtain a permit to dispose of ash or to operate a disposal site for ash. At the time of construction of the currently operational power station's ash dams and dumps, ash did not meet the legal definition of 'waste' and did not require an ECA Section 20 (1) permit.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

The regulation to exclude a waste stream or a portion of a waste stream from the definition of waste Government Notice 715 under Government Gazette 41777 published under the National Environmental Management Waste Act, 2008 (Act 59 of 2008), on 18 July 2018 requires a person or categories of persons who generates waste to apply for exclusion for waste stream for beneficial use from the definition of waste. Ash from combustion and gasification processes is identified as a waste stream for beneficial use and permitted for brickmaking, block making, production of cement, landfill capping, backfill in old mine workings, inorganic fertiliser, soil ameliorant and conditioner, asphalt and other bituminous mixtures, road construction, foundations and bulking agent for compositing. An application for the exclusion of a waste stream or a portion of a waste stream must be lodged with the Minister of Environmental Affairs.

NEM: WA has subsequently included ash in the definition of waste. However, Government Notice 921 of 29 November 2013, 7(1) provides that “a person who lawfully conducts waste management activity listed in this Schedule on the date of coming into effect of this Notice, may continue with such activity until such time that the Minister by notice in a Gazette calls upon such a person to apply for waste management licence.” Currently, existing lawful waste management activities do not have to undergo an EIA process or be licensed, until directed so by the Minister, in accordance with the transitional provisions in Section 82 of the NEMWA.

Ash disposal facilities are seen as Section 21(g) water use activities (“disposing of waste in a manner which may detrimentally impact on a water resource”), that is, they are regarded as an activity that has a potential to negatively impact water resources. All water use activities need to be licensed in terms of Section 21(g) of the National Water Act. This will also apply to gypsum if some of it is going to be dumped at the power station.

Fly ash material solidifies while suspended in the exhaust gases and is collected by electrostatic precipitators or filter bags. They consist mostly of silicon dioxide (SiO_2), which is present in two forms: amorphous, which is rounded and smooth, and crystalline, which is sharp, pointed and hazardous; aluminium oxide (Al_2O_3) and iron oxide (Fe_2O_3). Fly ash, like soil, contains trace concentrations of many heavy metals that are known to be detrimental to health in sufficient quantities. These can leach into the ground or surface water and cause contamination. These elements are however, found in extremely low concentrations in fly ash.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

Flue gas desulphurisation drastically removes sulphur dioxide from chimney emissions. Sulphur dioxide is a colourless gas produced when fossil fuels like coal and oil are burnt. It is extremely harmful to the environment and one of the main chemicals that can cause acid rain. Sulphur dioxide is harmful to plants and can damage trees. If sulphur dioxide emissions are cut down with the use of technologies such as flue gas desulphurisation, we will come one step closer to a clean environment.

B.4 Management requirements

- a) Implementation of effective measures to prevent ground water pollution by ensuring no leachate pollutes ground water.
- b) Groundwater monitoring is to be done at and around the ash dams and dumps. Reviews of groundwater monitoring results shall be undertaken. Based on the outcome, the appropriate mitigation required shall be determined to ensure avoidance and control of ground water contamination.
- c) Operational procedures and work instructions have been developed and implemented to ensure correct management and operation of the dams/dumps. These will only need to be updated to align with all relevant legislative requirements.
- d) Further research shall be undertaken to ensure that both ash and FGD waste should be analysed and classified to bring it under environmentally sound management practices.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

Appendix C: Hazardous waste: Electrical and electronic equipment (WEEE) (including CFLs, etc.)

As of 23 August 2016, no hazardous WEEE lamps in any form are accepted at landfills according to the national norms and standards for disposal of waste to landfill, GN R 636 of 2013. Eskom supports government's strategy to divert waste from landfill. The ban on hazardous WEEE lamps from landfill includes all fluorescent tubes, compact fluorescent light bulbs (CFLs) and light-emitting diodes (LEDs). Mercury-containing lamps and devices contain small quantities of mercury, cadmium and antimony, and proper disposal throughout Eskom is essential.

C.1 Environmental impacts

- a) Fluorescent tubes, for example, CFLs, are considered extremely hazardous waste and contain an average of 2 mg/kg of mercury (Hg) per lamp, as an essential ingredient for the generation of light, which is a known carcinogen. Other types may contain up to 15 mg of mercury.
- b) Light bulbs contain dangerous metals like mercury and cadmium that, if allowed to leach into the soil and groundwater, can pose serious concerns to human health and ecosystems. The mercury vapour that is released into the environment when lamps are broken pollutes the air and poses a risk to people through inhalation. It is estimated that a single fluorescent tube contains enough mercury to pollute 30 000 litres of water.
- c) Mercury compounds are chemically stable. Therefore, they do not readily break down over time or release the mercury into the water streams. All mercury-containing waste in Eskom will be pre-treated to form such a compound when crushed and stored for final disposal.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

C.2 Management requirements

- a) All fluorescent lamps and tubes are considered hazardous waste when discarded because they contain mercury and must be collected and recycled at an authorised recycling facility.
- b) Recycling of fluorescent tubes and lamps provides a total environmental solution, because it allows for the recovery of all fractions of the lamps and tubes.
- c) Recycled fractions of lamps and tubes includes glass, ferrous and non-ferrous metals, plastic, mercury and phosphor powder, which can all be recovered and used in suitable end processes and products.
- d) Fluorescent lamps and tubes should not be crushed on site.
- e) Waste generators must ensure that they obtain proof that the waste facility where their waste is recycled is authorised.
- f) Package, store and transport fluorescent light bulbs in containers that prevent them from breaking, such as in their original boxes, boxes from replacement bulbs or containers supplied by fluorescent light bulb recyclers.
- g) Store them in an area away from rain so that, if they break, rainwater will not wash the mercury from broken lamps or tubes into waterways.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

Appendix D: Oil (Hydrocarbon) management (Normative)

Due to the strategic nature of oils in Eskom equipment, aspects such as usage, handling, storage, transport and general control of the commodity need to be carefully managed. Eskom has standardised the use of uninhibited naphthenic insulating oil in electrical equipment. This oil is also often referred to as a mineral oil.

D.1 Environmental impacts

Insulating oil and other related hydrocarbon compounds pose a serious pollution problem once released into the environment. Not only do these compounds pose a fire hazard, but with one litre of oil having the potential to contaminate in excess of a million litres of water, it needs to be handled with care. Oil may rapidly penetrate certain soil types, which may lead to extensive environmental as well as groundwater and surface water contamination.

D.2 Management strategies

- a) Management will follow the requirements as listed in the SANS 290 document entitled: Mineral insulating oils (uninhibited) – Purchase, management, maintenance, testing and safe disposal.
- b) All insulating oil removed from any electrical equipment for inclusion in the Eskom oil pool will be tested for the presence of contaminants such as PCBs, solvents and synthetic oils, including electrical cleaner, silicone oil and motor oils.
- c) All oil (hydrocarbon) spill incidents within Eskom shall be reported electronically in line with the requirements of the Environmental Incident Management Procedure 240-133087117.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

D.3 Management requirements

D.3.1 Spillages of oil, solvents or hydrocarbons:

Eskom is committed to Zero Harm to people and the environment as an Eskom value, which forms an integral part of its operations. All hydrocarbon spills need to be assessed by completing the hydrocarbon spill assessment table (240-47176039). If the PCB levels of the oil are not known through prior testing, the spill shall be treated as a PCB spill, until such time that analysis proves otherwise. All hydrocarbon spill incidents within Eskom shall be reported electronically in line with the requirements of the Environmental Incident Management Procedure 240-133087117.

D.3.2 Spill on an Eskom site

D.3.2.1 Limit the spillage

The need for immediate corrective action to limit the spillage cannot be overemphasised because this will minimise the environmental damage and reduce remediation costs. This can involve actions such as:

- a) Closing a valve;
- b) Repairing the leak with rags, plugs or other appropriate material;
- c) Repositioning the container so that the leaking area is at the highest level or lifting a fallen drum/container;
- d) Placing a leaking container or equipment into a collecting tray or bund area; and
- e) Collecting the spilt oil in a container located underneath the leak or channelling the leak into a container.

D.3.2.2 Containing the spillage

The containment of a spill will involve an action that will either prevent or stop a spill from spreading. It is vital to prevent any oil spill from entering waterbodies such as drains, storm water systems, dams or rivers. Containment of the oil near the source will minimise pollution and will enable easy clean-up and/or remediation. This shall be done using one or more of the following:

- a) Soil barriers;
- b) Sand bags;
- c) Bund walls; and
- d) Absorbent materials.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

D.3.2.3 Removal of oil

The free oil (puddles) shall be captured and put into a suitable container, such as a drum or tanker, for proper disposal. This oil shall not re-enter the Eskom insulating oil pool for regeneration and reuse in electrical equipment.

D.3.2.4 Final clean-up/remediation

After removal of excess oil, saw dust, suitable absorbents or solvents shall be used to complete the clean-up of the spill. This might include the removal of leaking equipment, cleaning of pavements, removing contaminated soil and vegetation as well as disposing of clean-up equipment. The absorbing material shall be bagged and disposed of at a registered hazardous waste site.

D.3.2.5 Remediation of the land

The land must be remediated to its virgin state. This must be assessed first to determine contamination. The assessment must be taken out in accordance with requirements as set out in the norms and standards for the remediation of contaminated land. The norms and standards for remediation of contaminated land and soil quality in the Republic of South Africa, Government Notice 331 of 2 May 2014 stipulate a list of contaminants that need to be checked in order to confirm if land is contaminated. The contaminants include among others: chromium III and IV, lead, hydrocarbons and sulphates. If the soil screening values of hydrocarbons in this case exceeds the value stipulated in the norms and standards, it means that the land is contaminated and needs to be remediated. Remediation deals with the removal of pollution or contaminants from environmental media such as soil, groundwater, sediment or surface water. If a site has to remediate the land, the method of remediation must be decided on the site with the assistance from the Waste CoE.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

Appendix E: Polychlorinated biphenyl (PCB) management

PCBs are synthetic liquids with exceptionally high chemical and thermal stability. PCBs were mainly utilised as substitutes for mineral oil in high-powered electrical equipment to enhance thermal resistance. Their characteristics make them non-biodegradable, bio-accumulative and persistent organic pollutants (POPs) under the Stockholm Convention. PCBs can be found in dielectric fluid used in some electrical equipment, such as transformers and capacitors, for electrical insulation and thermal cooling.

E.1 Environmental impacts

As PCBs are not readily biologically degradable, they tend to be passed on through the food chain, and have thus been classified a POP. PCBs produce hazardous carcinogenic by-products under incomplete combustion.

E.2 Management strategies

- a) Persons in possession of items must take samples from the items and have them tested for PCBs by an accredited laboratory in accordance with SANS 290. The results must be kept until 2023.
- b) It is important to note that although oil and equipment at level 3 (<50 ppm) and below are considered non-PCB materials in accordance with the Stockholm Convention on POPs, the strategy within Eskom is to ultimately work towards achieving level 0.
- c) All PCB holders must label their articles in accordance with SANS 290.
- d) The management, handling and disposal of PCBs will be done in accordance with SANS 0290: 2008: Mineral Insulating Oils – Management and Handling of Polychlorinated Biphenyl (PCB). Phase-out will be done in accordance to EPC 32-1135: PCB Phase-out Standard.
- e) In line with the Stockholm Convention and Regulations to phase out the use of PCBs, Eskom is committed to the phasing out of PCBs.
- f) Eskom will not

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

- Use any PCB materials or PCB-contaminated materials after the year 2023.
 - Have any PCB materials, PCB-contaminated materials or PCB waste in their possession after the year 2026, excluding disposed PCB waste.
- g) Eskom has registered as a PCB holder in accordance to the PCB regulations. The registration number is 14/11/11/PCB/021.
- h) All owners of PCBs within Eskom must develop and maintain a PCB inventory template (240-51752992) that has been accepted and signed by the employer.
- i) A comprehensive PCB management and phase-out plan shall be developed by each Eskom Division for PCBs more than 50 ppm.
- j) Progress on the PCB phase-out plans will be reported on a six-monthly basis as required by this procedure.
- k) The PCB inventory and phase-out plan will be subject to internal or external audits in accordance with the business requirements.
- l) This section on PCB management must be read in conjunction with the EPC 240-84908008 or 32-1135: PCB Phase-out Standard, March 2015.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

Appendix F: Asbestos management

Eskom Standard Requirements for the Safe Processing, Handling, Storing, Disposal and Phase-out of Asbestos and Asbestos-containing Material, Equipment and Articles (Ref. 32-303), under the purpose, give practical expression to Eskom's commitment to protecting people and the environment against the harmful effects of regulated asbestos fibres and expresses the requirements for asbestos phase-out programmes. An asbestos phase-out programme refers to the removal of asbestos and asbestos-containing material (ACM) and/or replacement with non-asbestos material over a time period specified by the Business Unit in the asbestos phase-out plan/programme.

The OU/BU responsible manager shall ensure that all asbestos and ACM are identified and recorded in an inventory by a suitably experienced and qualified person, that is, a person competent in the identification of asbestos and ACM as well as in the formulation of the relevant inventories and phase-out plans. This appendix deals with the management and control of asbestos and ACMs, equipment and articles. All management and control of asbestos should be done according to Section 20 of the Asbestos Regulations of 2001. For more information on the general management of asbestos and the safe processing, storage, removal and handling of ACMs, equipment and articles, Eskom Standard for Requirements for Safe Processing, Handling, Storing, Disposal and Phase-out of Asbestos and Asbestos-containing Material, Equipment and Articles 32-303 should be used. An inventory (template 240-47175987, found in Asbestos Procedure, 32-303) of asbestos and ACMs must be kept by the owner thereof.

F.1 Environmental impacts

ACMs were historically used for lagging and insulation purposes, especially at power stations. Being a POP, it is listed under the Rotterdam Convention as an Appendix A chemical and has therefore been banned in South Africa for imports, exports, mining and manufacturing. It further has health effects because the inhalation of these regulated asbestos fibres causes serious lung diseases, including asbestosis, cancer of the lungs and mesothelioma. These diseases usually become apparent only some years after exposure to asbestos, and sometimes up to 40 or more years after the first exposure.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

F.2 Management strategies

Eskom's strategy is to phase out asbestos as soon as possible but not later than November 2033. All owners of ACMs and equipment are required to have a plan for the phasing out of asbestos. Where there is immediate risk, asbestos should be removed and replaced by non-ACM or as part of normal maintenance.

F.3 Management requirements

F.3.1 Asbestos inventories

All asbestos and ACM shall be identified and recorded on an inventory by the employer, in line with the Asbestos Inventory Template (240-47175987). If such material does not belong to the employer, the owner should provide the inventory, but in such a case the onus is on the employer to verify the correctness and applicability of the information on the inventory. The Asbestos Inventory Template (240-47175987) should be completed or updated as required. Where significant changes to the initially identified risks are noted, the risk assessment should be updated to reflect the new risk status. The inventory shall be kept on record for a period of 40 years.

The purpose of an inventory is to establish exact locations for asbestos or ACMs on site, to provide an estimate of the quantity of asbestos or ACMs on site, and to assess the condition of the material and to provide supporting information for an asbestos phase-out plan.

Where one is not sure if a particular material is, or contains, asbestos, it shall be handled as if it is an ACM until such time that it is confirmed as not containing asbestos. A swipe sample of dust collected on work surface areas, or on identified marked areas, should be collected and scanned under a contrast phase microscope for recognition of the presence of asbestos fibres by an accredited laboratory.

F.3.2 Requirements for the handling and disposal of asbestos

- The management, handling and disposal of asbestos and ACM will be done in accordance with Section 20 of the Environment Conservation Act 73 of 1989 ("ECA"), Regulation 20 of the Asbestos Regulations 2001, and Eskom Standard for Requirements for Safe Processing, Handling, Storing, Disposal and Phase-out of Asbestos and Asbestos-containing Material, Equipment and Articles, 32-303.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

- All used air filters from vacuum cleaners, air conditioners and ventilation equipment shall be placed in impermeable bags, or similarly effective containers. These containers shall be sealable for disposal (the outside of all containers shall be cleaned before leaving the workplace).
- Asbestos and ACM must be transported in accordance with the minimum requirements of Eskom Standard for Requirements for Safe Processing, Handling, Storing, Disposal and Phase-out of Asbestos and Asbestos-containing Material, Equipment and Articles Standard 32-303 as well as in accordance with SANS 10228 and SANS 10229.
- All owners of asbestos and ACM will develop and maintain an asbestos inventory and phase-out plan in order to meet the Eskom phase-out date of 2033.
- Waste shall be disposed of only on waste disposal sites specifically designated for this purpose in terms of the Environment Conservation Act, 1989 (Act 73 of 1989), ECA, 1989, or the National Environmental Management Waste Act, 2008 (Act 59 of 2008), NEMWA 2008.
- Asbestos that has been disposed of will be reported on a six-monthly basis as required by this procedure using the Waste Reporting Template (240-47176064).
- In order to avoid the spread of asbestos dust, employers and self-employed persons must ensure that asbestos and asbestos-containing articles or substances are identified, classified, packed, labelled and handled in accordance with SANS 10228 and 10229.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

Appendix G: Health care risk waste

Health care waste (HCW) must be managed adequately in order to control the potential spread of infectious diseases that can put waste disposal workers and the public at risk. HCW comprises health care general waste (HCGW), the non-hazardous component of HCW and HCRW, posing a risk to human health and the environment. Eskom generates HCGW and HCRW at the various health care facilities it operates. HCRW must be managed in accordance with Eskom Health Care Waste Risk Management Standard (Ref: 240-115842952), General Notice 1229 and other related documents.

G.1 Environmental impacts

Exposure to HCRW can result in health risks to the public, patients, health care workers, waste managers and the environment. Waste management measures can reduce such risks substantially.

G.2 Management strategies

Segregation and minimisation are the most important steps to successively manage HCRW. The management strategies will be managed in accordance with Eskom Health Care Waste Risk Management Standard (Ref: 240-115842952) and SANS 102148(1, 2, 3).

G.3 Process for disposal and monitoring

- HCGW and HCRW shall not be disposed of by burning, dumping or burying in pits or in trenches.
- HCRW shall not be treated by sterilisation and/or incineration as prescribed in SANS 102148 (1, 2, and 3).
- HCGW and HCRW shall be disposed of at authorised landfill sites/treatment facilities.
- Records for awareness and disposal must be kept at each clinic of all HCW management practices.
- All records must be accessible and must be kept for purposes of monitoring and measurement of HCRW practices.
- The health care facilities shall retain documented evidence from waste management practices/activities.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

Appendix H: Metals

Waste metal is an important industrial raw material. The melting of scrap metal saves resources and energy as compared with the use of newly extracted ores. Metal waste that contains hazardous substances or electronic components should be treated separately during disposal.

Metals can be divided into two broad categories: ferrous- and non-ferrous metals. Ferrous metals are iron and surface-treated iron, while non-ferrous metals include copper and copper alloys, zinc, lead, aluminium, tin and precious metals, such as gold and silver. Metal equipment may be coated with paints (paint may be lead-based) or PCB-containing oil, which may have separate environmental hazards of their own.

The purpose of this section is to provide guidelines for the recycling, disposal and selling of metals in a manner that promotes sustainability and prevents pollution, in line with the Eskom SHEQ Policy (EPL 32-727).

H.1 Environmental impacts

Eskom's plant and operating equipment (for example, transformers, electrical cable, substation equipment, etc.) consist largely of metal. Once equipment is replaced or decommissioned, metal parts are reused, sold as scrap metal through the procurement process or disposed of along with other materials. Scrap metal, whether sold or disposed of, is a waste stream that requires management in order to prevent environmental degradation or threats to human health and well-being.

H.2 Management strategies

The sale of an Eskom asset should be performed in accordance with Eskom's Procurement and Supply Chain Management Procedure, 32-1034.

H.3 Management requirements

In line with the principles of waste minimisation, scrap metal should first be reused or recycled before disposal to landfill is considered. All disposals of Eskom assets will be in compliance with the commercial policies and procedures applicable and the process approved by the approved delegated authority. Ensure that these service providers are authorised to reuse/recycle scrap metals by producing a recycler's permit. The Investment Recovery Section is responsible for ensuring that contracts for the selling and the disposal of scrap metal address the matters outlined below:

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

H.3.1 Non-ferrous metals (copper, aluminium, etc.)

Disposals of all metals, including non-ferrous metals, must be done through the Investment Recovery Section. Sources of non-ferrous metal waste:

- Stores
- Substations and construction camps
- Dismantling of disused lines
- Reconducting projects

H.3.2 Scrap steel, etc. (ferrous metal)

To maximise the return of Eskom scrap returned to stores and simplify the disposal process of these commodities, local or regional annual contracts will be established by the Investment Recovery Section, covering all stores and workshops. To improve the monetary return of the sale, it is suggested that some form of sorting into the different commodities be performed, for example:

- Steel subgrade
- Steel heavy grade
- CTs, VTs (current transformers, voltage transformers) and switchgear
- Plastic and PVC
- Wood/general clean-up

H.3.3 Metals coated with other hazardous substances

Metal equipment contaminated with PCB-contaminated oil may not be sold. Such metal equipment must be destroyed by thermal destruction.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

Appendix I: Disposal and safe handling of contaminated sulphur hexafluoride gas (SF₆) and its by-products

Sulphur hexafluoride (SF₆) is a colourless, odourless, non-flammable gas, which is primarily used in the electrical and electronics industry as insulation in switchgear and circuit breakers as an insulating and arc extinguishing (quenching) medium. Gas suppliers such as Afrox and Air Products supply SF₆ gas cylinders to Eskom. SF₆ is a greenhouse gas emissions caused by the energy sector. SF₆ is listed as one greenhouse gas emission at the Paris Agreement December 2015. Paris Agreement goes beyond the Kyoto Protocol and aims at enhancing adaptive capacity, strengthening resilience and reducing the vulnerability to climate change.

I.1 Environmental impacts

The purpose of this section is to communicate and ensure the safe handling and disposal of SF₆ gas and its by-products. The gas is not hazardous in itself, but readily displaces oxygen, thus causing an asphyxiation risk. When discharged into the atmosphere, SF₆ may contribute to the greenhouse effect. The US Environmental Protection Agency has identified SF₆ as a greenhouse gas with a global warming potential 23 900 times the effect of an equal mass of carbon dioxide and an atmospheric lifetime of 3 200 years.

According to the Intergovernmental Panel on Climate Change, SF₆ is the most potent greenhouse gas that it has evaluated, with a global warming potential of 22 800 times that of CO₂ when compared over a 100-year period. SF₆ is one of the heaviest known gases: in normal conditions it is about five times heavier than air.

I.2 Management strategies

I.2.1 In the event of an SF₆ leakage:

- Evacuate the affected areas and report any incident to the responsible manager of the unit/area immediately.
- Remove sources of heat and electrical arcing. Provide adequate ventilation by ventilating the area until the air/oxygen levels are normal (a minimum volume of 18% O₂).
- Carry out air quality monitoring with calibrated measuring equipment.
- Emergency personnel must use self-contained breathing equipment when entering areas where significant leaks have occurred. Remove leaking movable containers or cylinders outdoors into an open area with good ventilation. Record the amount of gas discharged.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

- Defective cylinders must be tagged as defective and returned to the supplier as soon as possible.

I.2.2. Handling and storage

Storage and transportation of SF₆ shall be performed according to international and local regulations. The measures given in the material safety data sheet (MSDS) should be followed.

An empty SF₆ container can still contain a residual amount of SF₆. It shall be stored and transported in the same way as for a filled container.

Containers should be handled carefully and stored in a cool, dry, well-ventilated area away from flammable or explosive material.

The owner of the electric power equipment utilising SF₆ is responsible for the proper use, transportation, and disposal of the equipment and the gas.

All SF₆ GIS plants and storage areas must have a clearly visible safety sign at the entrance identifying the plant as an SF₆ plant. Signs indicating the following must also be provided:

- Prohibiting smoking during maintenance work or emergencies.
- The location of protective equipment (respiratory protection).
- Warnings that when plant fails or where maintenance work is being done on switchgear, SF₆ gas and its by-products are hazardous, and that protective equipment must be used (for example, spilling, burning through, maintenance).
- The location of an emergency shower.
- A notice stating that enclosed and lower-situated areas must be ventilated when emergencies occur.
- All safety signs must comply with the requirements of SANS 0140, Parts 1 and 2, and the colours must comply with SANS 1091.
- SF₆, a high-pressure liquefiable gas, is kept in Class 3 containers as minimum (SANS 10019). Cylinders must be inspected, handled, stored, transported and used in accordance with the requirements set out in SABS 019. A register of such inspections must be kept.

I.3 Management requirements

I.3.1 Cylinder marking

SF₆ cylinders are supplied to Eskom by the gas suppliers with testing markings, volume and mass capacities and serial numbers stamped on the cylinder shoulder to indicate quality testing. Identifying colour is "Protea" pink.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

I.3.2 Disposal of empty cylinders (B49 SABS 0140)

SF₆ cylinders as minimum are classified as Class 3, metallic pressure receptacles of welded construction where the seams have been partially radiographed in accordance with an approved Standard (SANS 10019). Only refilling with SF₆ gas is allowed. The reuse of cylinders for any gas other than SF₆ or any other purpose is subject to the prior approval of the Department of Labour and compliance with the requirements of SABS 019. Cylinders should be returned to the supplier when empty or leaking. Cylinders contaminated with by-products must be decontaminated by a licensed facility before reuse.

I.3.3 Disposal of solid SF₆ by-products or decomposition products

The solid SF₆ by-products or decomposition products are treated with calcium chloride (CaCl₂ 6H₂O) or sodium bicarbonate (NaHCO₃) to form a non-toxic end product. Disposal of hazardous waste must be done at permitted/licensed facilities. The disposal of containers must only be handled by the gas supplier.

I.3.4 Thermal destruction

Destruction of contaminated SF₆ and the decontamination of redundant SF₆ cylinders may be done using thermal desorption. Only DEA-approved facilities may be used for this activity.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

Appendix J: Waste reporting for Eskom

Eskom supports government's commitment to waste management in order to protect health by ensuring that data is stored, verified and analysed before submitting the information to SAWIS. Most Eskom Business Units are registered as hazardous waste generators. Generation landfill sites ash disposal facilities are registered as disposal of general waste to land covering an area in excess of 200 m².

SAWIS is the national waste information system established in terms of Section 60 of the National Environmental Management: Waste Act, 2008 (Act 59 of 2008). SAWIS was established to record, collect, manage and analyse the data and information that must include data of on the quantity and type or classification of waste generated, stored, transported, treated, transformed, reduced, reused, recycled, recovered and disposed of.

Waste CoE recognised the need to develop and maintain generic reporting guideline in order to assist with the identification of problem waste streams or waste streams that occur in large quantities, which may require the development of specific strategies to manage the waste streams and/or their impacts and to support the diversion of waste from landfill, thereby promoting waste reuse, recycling and waste exchange opportunities.

Waste reporting must be in accordance with the Eskom Indicator Reporting Standard (Ref: 32-249) and other legislative requirements applicable.

Divisions and all other generators of wastes will classify their wastes and rank them according to legislative requirements. This should be based at minimum on the following classification system (see Tables 1 and 2 below):

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

J.1 Waste reporting guideline

GW 01 – Municipal waste

Municipal waste can also be defined as domestic waste. The Waste Act, 2008, defined domestic waste as waste that emanates from premises that are used wholly or mainly for residential, educational, health care, sport and recreation purposes, which is composed of mainline recyclables (including paper, plastic, glass, metals and tyres), organic waste (including garden and food waste), construction and demolition waste and non-recyclables. Eskom can choose this option if the municipality is providing a service (for example, collection and disposal).

GW 10 – Commercial and industrial waste

Commercial and industrial waste is not defined by the Waste Act, 2008. This waste stream emanates from premises that are used wholly or mainly for commercial, retail, wholesale, entertainment or government administration purposes. The composition of commercial and industrial waste is related to the type and scale of industries prevalent in a specific region. A large portion of this waste stream is collected as part of the municipal waste stream and contains mainly mainline recyclables from offices as well as organic waste. It should, however, be noted, that pre-consumer recyclables from industrial sources are not collected as part of the municipal waste stream but typically collected by the recyclers themselves. Eskom must choose this option when reporting general waste.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

GW 13 – Brines

Saline or brine waste is a waste stream containing salts. It is actually a concentrated watery solution, typically containing 1-6% of dissolved low-value salts (NaCl), emanating from the reverse osmosis or wastewater treatment process from the industries. The Waste Classification and Management Regulations of 2013 restrict the disposal of brine or waste with a high salt content (TDS \geq 5%) and a leachable concentration for TDS of more than 100 000 mg/l to landfill in August 2021. Based on the classification reports, Brine classified as non-hazardous must be reported here.

GW14 – Fly ash and dust from miscellaneous filter sources

Fly ash is a light form of coal ash that floats into the exhaust stacks. Fly ash is collected from the exhaust gases by electrostatic precipitators or bag filters. Based on the classification reports, fly ash classified as non-hazardous must be classified here.

GW15 – Bottom ash

Bottom ash is the coarse, granular, incombustible by-product of coal combustion that is collected from the bottom of furnaces. Based on the classification reports, bottom ash classified as non-hazardous must be reported here.

GW16 – Slag

Slag includes ferrous metal slag from steel, manganese, chrome, vanadium, etc. processing and non-ferrous metal slag from aluminium, etc. processing. Based on the classification reports, slag waste classified as non-hazardous must be reported here.

GW17 – Mineral waste

The mineral waste included is limited to foundry sand and refractory waste. Based on the classification reports, mineral waste classified as non-hazardous must be reported here.

GW18 – Waste of electric and electronic equipment (WEEE)

This waste stream refers to discarded electrical and electronic equipment including computers, cell phones, televisions, radios, refrigerators, washing machines, etc. Basically, anything that operates using electricity or batteries that has reached the end of its useful life. It also includes lighting equipment, such as fluorescent tubes and lamps, sodium lamps, etc. Due to chemicals contained in some WEEE, Eskom must report all WEEE under HW18.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

GW 20 – Organic waste

Organic waste refers to garden, food and wood waste only. The food waste component represents kitchen waste as well as pre-consumer condemned foods. Organic waste is generally reported as garden, green, putrescible and, in some instances, notifiable waste. All garden and food waste is recyclable provided that the most suitable treatment options are considered. All organic waste must be reported here.

GW21 – Sewage sludge

This waste stream includes the sludge resulting from sewage plant processes. This code can be used if sewage sludge is classified as non-hazardous waste.

GW 30 – Construction and demolition waste

The Waste Act, 2008 (as amended in 2014), defines building and demolition waste as “waste excluding hazardous waste, produced during the construction, alteration, repair or demolition of any structure and includes rubble, earth, rock and wood displaced during that construction, alteration, repair or demolition”. As such, construction and demolition waste includes, but is not limited to, concrete, bricks, masonry, ceramics, metals, plastic, paper, cardboard, gypsum drywall, timber, insulation, asphalt, glass, carpeting, roofing, site clearance, excavation material and site sweepings. This code must be used for all construction and demolition waste not containing hazardous waste or hazardous chemicals.

GW 50 – Paper

This waste stream includes all different grades of paper: office paper to newspapers, magazines, telephone directories and boxes, cardboard, white and coloured office paper, newspaper, glossy paper (magazines) mixed grades and non-recyclable paper.

GW 51 – Plastic

Plastic waste consists mainly of six materials, all polymers mainly from petrochemical origin, including polyethylene terephthalate (PET); high-density polyethylene (HDPE); polyvinyl chloride (PVC) – rigid (PVC-U) and flexible (PVC-P); low and linear density polyethylene (PELD and PE-LLD); polypropylene (PP) including expanded polystyrene (PS-E); polystyrene (PS). Many plastics are packaging materials including bags, bottles and a variety of other containers, but it is also present in the form of pipes, furniture, textiles.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

GW 52 – Glass

This waste stream constitutes many different types of glass including bottles, jars, flat/sheet glass, laboratory glass, mirrors, windshields and window glass, crystal and opaque drinking glasses, heat-resistant ovenware (for example, Pyrex and Vision ware)

GW 53 – Metals

Metallic wastes are divided into two broad categories: ferrous metals (steel and iron), accounting for 80% of metal waste; and non-ferrous metals (aluminium, copper, zinc, lead, nickel and others), accounting for 20% of metal waste.

GW 54 – Tyres

All new, used, rethreaded or roadworthy tyres, not suitable to be rethreaded, repaired or sold as a part-worn tyre and not fit for its original intended use must be reported under this code.

GW 99 – Other

The waste reported in this category is waste that is general but does not fit into any of the above categories. It is typically the result of mixed hazardous waste that cannot be separated into for-treatment purposes.

HAZARDOUS WASTE**HW 01 – Gaseous waste**

Gaseous waste refers to the gas remaining in gas cylinders and aerosol cans at the end of its use. It includes speciality gases such as those that would be used by the research laboratories as well as for gas stoves, heaters, camping gas. etc. Examples include HCl, NH₃, acetylene, powder extinguisher, N₂, Cl₂, etc. Gas waste cannot be disposed of in any other way than being destroyed, for example, by thermal means or chemical reaction. The empty cylinders are normally reused, but if they are damaged and cannot be reused, the cylinders become scrap metal. Empty aerosol cans are also recyclable. All gaseous waste, including obsolete ozone-depleting gases and other gases (excluding greenhouse gases), are reported here.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

HW 02 – Mercury-containing waste

All liquid and solid waste containing mercury except CFLs (reported as WEEE [HW18])) is reported here. Examples of this waste stream include COD (Chemical Oxygen Demand) test liquids and other mercury-containing test liquids; mercury-treated seed grain, small packages of chemicals, thermometers, etc.

HW 03 – Batteries

Batteries include all batteries that end up in the waste stream, including lead batteries, mercury batteries, Ni/Cd batteries, manganese dioxide and alkali batteries, lithium and lithium-ion batteries, nickel-metal hydride batteries and any other type of battery. All batteries must be reported here.

HW 04 – POP waste

POP waste refers to 'persistent organic pollutants' or chemical substances that persist in the environment, bio-accumulate through the food web and pose a risk of causing adverse effects to human health and the environment. It is normally associated with pesticides. PCB-containing waste (>50 mg/kg), such as capacitors containing PCB, transformers containing PCB, transformer oil, etc., is included, and all other POP must be reported here.

HW 05 – Inorganic waste

Inorganic waste refers to all solid, liquid and sludge inorganic waste, including spent pot linings (inorganic). Examples include filter cakes, waste gypsum, hardening salts containing NaCN and Ba (CN)₂, inorganic salts, inorganic wood-preserving chemicals, inorganic waste catalysts, borates, etc. Oxidising waste, such as perborates, bromates, perbromates, chlorates, perchlorates, chromates, dichromates, hypochlorite, iodates, periodates, manganates, permanganates, red lead, nitrite and nitrate salts, inorganic peroxides, aluminium chloride (water free), chlorosulphonic acid, ferric chloride (water free), phosphorus oxychloride, etc. Reactive waste, such as phosphorus pentoxide, alkali metals (for example, Na) and their alloys, aluminium (powder), metal amides, carbides, chlorosilanes, ferrosilicon hydrides, lithium aluminium hydride, phosphides, silicides, etc. Liquid acidic waste (pickling acids, chrome sulphur acids, chrome acids, ferrous and ferric chloride solutions, hydrofluoric acid, galvanic baths, H₃PO₄, HNO₃, HCl, H₂SO₄), liquid basic inorganic waste without cyanide (hypochlorite solutions, metal hydroxide sludges, NaOH), alkaline inorganic waste with cyanide (pH>10), reactive waste, such as hydrogen peroxide, thionyl chloride, silicon tetrachloride, sulphur dichloride, titanium tetrachloride, etc., are also included.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

HW 06 – Asbestos-containing waste

All waste containing asbestos from insulation, buildings, etc. are included in this waste stream. Asbestos actinolite, asbestos grunerite (amosite), asbestos anthophyllite, chrysotile, crocidolite, asbestos tremolite or any mixture containing these fibrous silicates must be reported here.

HW 07 – Waste oils

Waste oils include diesel oil, fuel oil, heating oil, gas oil, hydraulic oil, lubricating oil, oil from oil and petrol traps, heat transmission oils (no PCB), etc. Waste oil typically originates from the crankcase of internal combustion engines (mainly run on petrol or diesel). Used oil or waste oil is also produced and collected from other operating equipment and includes products such as hydraulic oils, gear and transmission oils. It is not recommended that used oils from transformers and switchgear be mixed with other waste oils. Waste oils is a complex mixture of paraffinic, naphthenic and aromatic petroleum hydrocarbons that may contain one or more of the following: carbon deposits, sludge, aromatic and non-aromatic solvents, water (as a water-in-oil emulsion), glycols, wear metals and metallic salts, silicon-based antifoaming compounds, fuels, polycyclic aromatic hydrocarbons (PCHs) and miscellaneous lubricating oil additive materials. In the unlikely event that used transformer oils are mixed with other waste oil then polychlorinated biphenyls and terphenyls (PCBs/PCTs) may also be present. Oil generated from the kitchen must be reported under “other waste”.

HW 08 – Organic halogenated and/or sulphur-containing solvents

Solvents containing halogens and/or sulphur are included in this waste stream. Examples include chloroform, CS₂, chloromethane, freon, methylene chloride, perchloromethane, tetrachloromethane, trichloromethane, trichloroethylene, cutting oil and drilling oil containing more than 1% of halogen and sulphur, halogen-containing glue waste, waste from dry-cleaning companies, etc.

HW 09 – Organic halogenated and/or sulphur-containing waste

This waste stream comprises solids, liquids and sludges containing halogens and/or sulphur.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

HW 10 – Organic solvents without halogens and sulphur

This waste stream refers to solvents without halogens and sulphur. Examples include: acetone, alcohols, oil from animals, benzene, petrol, butyl acetate, ether, ethyl acetate, thinner, hexane, methyl ethyl ketone, methyl isobutyl ketone, oil emulsions, petroleum ether, styrene, synthetic oils, turpentine, toluene, vegetable oil, xylene, and oxidising solvents, such as acetone peroxide, acetylacetone peroxide, cyclohexanone peroxide, dibenzoyl peroxide, methyl ethyl ketone peroxide, etc.

HW 11 – Other organic waste without halogens or sulphur

This waste stream includes spent pot linings (organic), liquid, solid and sludge organic waste. Examples include: waste water, acetic acids, organic acids, amines, degreasing baths, cutting oil and drilling oil, brake wash waters, ethylene glycol, formalin, paint, alkaline bath from acid washing, oil emulsions, phenols, polyols, synthetic oils, soap, tectyl corrosion prevention, printing ink, epoxy compounds, fixing baths, developers, etc. Filters, cup grease, lubricants, latex, glue, organic salts, organic wood-preserving chemicals, reactive waste, such as fertiliser (NH_4NO_3), fireworks, methylene diphenyl diisocyanate (MDI), toluene diisocyanate (TDI), laboratory waste, spray cans, empty containers, leaded antiknock compound sludges, waste leather dust, etc. as well as spent pot liner containing organic fractions, for example, mixed with organic carbon, are also included.

HW 12 – Tarry and bituminous waste

Waste from coal-based generated tar and petroleum-based manufactured bitumen (including asphalt).

HW 13 – Brines

Saline or brine waste is a waste stream containing salts. It is actually a concentrated watery solution, typically containing 1-6% of dissolved low-value salts (NaCl), emanating from the reverse osmosis or waste water treatment process from the industries. The Waste Classification and Management Regulations of 2013 restrict the disposal of brine or waste with a high salt content ($\text{TDS} \geq 5\%$) and a leachable concentration for TDS of more than 100 000 mg/l to landfill in August 2021. All hazardous brines must be reported here.

HW 14 – Fly ash and dust from miscellaneous filter sources

Fly ash is a light form of coal ash that floats into the exhaust stacks. Fly ash is collected from the exhaust gases by electrostatic precipitators or bag filters. Based on the classification reports, fly ash classified as hazardous must be reported here.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

HW 15 – Bottom Ash

Bottom ash is the coarse, granular, incombustible by-product of coal combustion that is collected from the bottom of furnaces. Based on the classification reports, bottom ash classified as hazardous must be classified here.

HW 16 – Slag

Slag includes ferrous metal slag from the processing of steel, manganese, chrome, vanadium, etc., and non-ferrous metal slag from the processing of aluminium, etc.

HW17 and GW 17 – Mineral waste

The mineral waste included is limited to foundry sand and refractory waste.

HW 18 – Waste of Electric and Electronic Equipment (WEEE)

This waste stream refers to discarded electrical and electronic equipment including computers, cell phones, televisions, radios, refrigerators, washing machines, etc. Basically, anything that operates using electricity or batteries that has reached the end of its useful life. It also includes lighting equipment, such as fluorescent tubes and lamps, sodium lamps, etc. All WEEE must be reported here.

HW 19 – Health care risk waste (HCRW)

This waste stream includes pathological waste, infectious waste, sharps and chemicals, for example, pharmaceuticals.

HW 20 – Sewage Sludge

This waste stream includes the sludge resulting from sewage treatment processes. All sewage waste classified as hazardous waste must be reported here.

HW 99 – Miscellaneous

The waste reported in this category is waste that is hazardous but does not fit into any of the above categories. It is typically the result of mixed hazardous waste that cannot be separated into for-treatment purposes.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

J.2 Priority waste reporting

- Accurate and frequent reporting by each activity in the organisation is thus required to ensure that a proper account is made of the quantities of wastes, the types of wastes and the processes from which waste is produced.
- Priority wastes and waste management activities will be reported on within the organisation on a six-monthly and annual basis as listed below:
- Priority wastes identified for reporting include ash produced, disposed and recycled, radioactive waste, PCB and asbestos waste generated and disposed of;
- Progress on the development and implementation of the divisional waste management plan (WMP);
- Updating of PCBs inventories and phase-out plan and progress in completing the phase-out plan;
- Updating of ODS inventories and phase-out plan and progress in completing the phase-out plan;
- Information on Eskom-owned waste sites, including all waste disposed of at Eskom waste disposal facilities; and
- Information on waste stored at waste transfer facilities, including Eskom-owned facilities.

J.3 Reporting of other wastes

a) Reporting of the following wastes and waste activities will also take place. The report will include information on:

- General waste that was generated and disposed of;
- Hazardous waste (not on the priority list) that was generated, stored, treated or disposed of;
- Waste that was reused or recycled; and
- New waste streams generated within the business.

b) Reporting frequency

- Waste reports are required by the Risk and Sustainability Division on a quarterly and annual basis, but the divisions are encouraged to maintain their records on a monthly basis.

c) Reporting format

The template for Eskom waste reporting (240-47176064) must be used and as a minimum have the following information as sign-off:

- Date of submission

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

- Reporting period – period to which report applies
- Business area covered by report, including any exclusion
- Name of person submitting report
- Name of responsible manager (that is, power station manager, regional engineering manager, grid manager)

d) Waste densities for conversions are tabled in Table 3 below.

J.4 Reporting on SAWIS

- a) The Business/Operating Units via the Waste CoE are required to register with the SAWIS in accordance with the National Waste Information Regulations, GN R 625 of 13 August 2012. If an activity listed in the Waste Information Regulations is undertaken in a province that has an established waste information system, then the person undertaking that activity must submit the information to the Provincial waste information system.
- b) Gauteng and Western Cape have their own established waste information systems: The Gauteng Waste Information System and the Integrated Pollutant and Waste Information System (iPWIS) in Western Cape.
- c) Business/Operating Units conducting the following activities must register on SAWIS:
- Disposal of general waste to land covering an area in excess of 200 m².
 - Disposal of any quantity of hazardous waste to land.
 - Generators of hazardous waste in excess of 20 kg per day.
 - Recovery or recycling of waste of general waste at a facility that has an operational area in excess of 500 m².
 - Recycling of hazardous waste in excess of 500 kg per day calculated as a monthly average.
 - Treatment of waste of general waste using any form of treatment at a facility that has the capacity to process in excess of 10 tons of general waste or 500 kg of hazardous waste per day excluding the treatment of effluent, waste water or sewage.
- d) Registration of waste management activities allows DEA to issue a unique identification number, to be used when providing data to the SAWIS.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

Table 3: Densities used in calculating the mass based on volume according to the SAWIS

Waste type	Typical contents/containerisations	Typical density kilogram/m ³
Domestic waste, non-compacted	Mixed domestic waste	200
Domestic waste, compacted	Mixed domestic waste in compactor vehicles	500
Mixed domestic waste	Contents of closed wheelie bins (190 – 660 litres)	108
	Contents of bags (e.g. 160 – 240 litres)	95
Organic waste (garden waste and food waste)	In closed plastic containers (190 litres)	250
	In ventilated containers/bags	205
	Contents of compactor vehicles	450
	Organic waste from kitchens for animal fodder	840
Mixed biodegradable domestic waste	Contents of closed wheelie bins (190-660 litres)	60
	Contents of compactor vehicles	400
	Bulky waste in skips	90
Paper and cardboard	Corrugated cardboard	88
	Newspaper and magazines	200
	Office paper (compacted)	475
Other waste	Glass from glass containers	325
	Electronic waste	235
	Batteries	1 375
Inert waste	Sand, concrete, bricks and fibre glass	1 500
Mixed non-compacted industrial waste	Paper and plastic	150
	Cardboard, gypsum boards, sawdust, textiles, leather	400
	Timber, demolition waste	600
	Casting sand, slag, ashes	1 500
Commercial waste-non-compacted	Mixed waste from shops, offices, hospitals, restaurants, park and garden waste	200
Other waste	Non-specified	1 000

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

J.5 Conversion from volumes to mass

The following conversions and calculations for asbestos-containing waste and ash are used when reporting waste.

1. Asbestos-containing waste

1.1 To convert volume to mass, the following calculation must be used.

$$\begin{aligned}\text{Mass} &= \text{Density} \times \text{volume} \\ &= \text{kg.m}^{-3} \times \text{m}^3 \\ &= \text{kg}\end{aligned}$$

1.2 To convert 210 ℓ drums to mass, the following calculation must be used.

$$\begin{aligned}1\text{m}^3 &= 1\,000\,\ell \\ X &= 210\,\ell \text{ drum} \\ X &= 210\,\ell \times 1\,\text{m}^3/1\,000\,\ell \\ &= 210\,\text{m}^3/1\,000\,\ell \\ &= 0.21\,\text{m}^3\end{aligned}$$

From here, one must follow the calculation in 1.1 above.

NB: Density for asbestos-containing waste is 400 kg/m³.

J.6 Ash produced

The total ash produced is calculated based on the ash content % and the coal burnt tonnage.

$$\text{Mass of ash produced} = \text{Total coal burnt multiply by \% ash content}$$

J.7 Ash disposed

The ash disposed is calculated based on the following calculation.

$$\text{Ash disposed} = \text{Ash produced} - \text{Ash recycled} - \text{Ash emitted}$$

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

Appendix K: Solvents

Solvents and cleaners are widely used in Eskom for the removal of waxes, greases, oils, carbon and various other contaminants from equipment during routine maintenance and general cleaning. Increasing environmental and worker safety concerns as well as tightening government regulations resulting in the stricter control of these solvents and cleaners, many of which are classified as toxic.

K.1 Environmental impacts

The purpose of this procedure is to prescribe methods for managing solvents throughout the organisation. It covers Eskom's requirements for the storage, handling, disposal and reporting of all solvents. Solvents can be regarded as hazardous due to their potential environmental impacts, including air pollution, water and soil contamination, harm to wildlife, fire hazard and health hazards, among others poisoning, damage to the human body and disorders.

K.2 Management strategies

Storage of solvents must be in accordance with the specific minimum requirements of the MSDS. To ensure the safe storage of chemicals, the store must be designed to cater for possible spills, fire and other mishaps and must conform to the minimum requirements specified in SANS 10108.

K.3 Management requirements

K.3.1 Storage

- a) Determine the flash points and volatility of solvents, and ensure that the storage facility caters for these factors.
- b) Use the appropriate personal protective equipment as recommended on the SDS or the container label.
- c) Store all solvents in temperature-controlled environments, or as specified on the SDS, and away from direct sunlight.
- d) Store flammable solvents, if possible, where special ventilation and electrical systems minimise the possibility of accidental fire or explosion.
- e) Store flammable solvents in tightly closed safety containers.
- f) Dispense solvents, from safety-approved nozzles and dispensers only, into clearly marked containers.
- g) Store solvents away from oxidisers.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

- h) Check storage containers regularly to make sure that the spout, cap and container are in good working order and not leaking.
- i) Immediately replace damaged container parts such as flame arrester screens.
- j) Smoking and eating in solvent storage areas or around dispensing containers are prohibited.
- k) The location of spill control stations and materials, eyewash stations and safety showers must be clearly indicated/demarcated.
- l) Usage
- m) The prescribed PPE and other protection measures must be used when working with solvents, unless otherwise stated in the Occupational Health and Safety Risk Assessment.
- n) All solvents must be used in conjunction with safe working procedures.
- o) All lighters, matches or sparking devices are to be removed before a worker handles solvents.

K.3.2 Disposal

- a) Every solvent manufacturer has its own disposal procedures and these must be reflected on the SDS.
- b) Additional requirements:
- c) Solvent waste must be removed from the work area and disposed of only at permitted/licensed waste disposal sites and by using appropriate removal contractors, in accordance with the relevant regulations.
- d) Final disposal of solvent waste, including the mode of transport, must be in accordance with the relevant legislation and is subject to approval by the applicable business unit.
- e) Records must be kept of the quantities disposed of.
- f) Flammable solvents must be disposed of in approved containers, never directly into sewers, storm water drains, garbage dumps or onto the ground.

K.3.3 Training

- a) Ensure that all users of solvents are informed or trained in the purchase, storage, usage and disposal of solvents.
- b) Employees must be informed about the contents of an SDS.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

Appendix L: Ozone-depleting substances

Ozone-depleting substances (ODSs) are compounds that contribute to the depletion of stratospheric ozone. These ODSs are generally very stable in the troposphere and degrade under ultraviolet light in the stratosphere, releasing chlorine or bromine atoms, which deplete ozone. The ODSs are split into two groups such as chlorofluorocarbons (CFCs), and hydrochlorofluorocarbons (HCFCs). The most common HCFC in use today is HCFC-22 or R-22, a refrigerant still used in existing air conditioners and refrigeration equipment.

The following controlled substances are most frequently utilised commercially:

Annexure A:

- CFC11 trichlorofluoromethane – Air-conditioning, insulation materials, aerosols, solvents
- CFC12 dichlorodifluoromethane – Refrigeration, air-conditioning, insulation materials, aerosols
- CFC113 trichlorotrifluoroethane – Insulation materials, aerosols, solvents, air-conditioning
- CFC114 dichlorotetrafluoroethane – Insulation materials, aerosols
- CFC115 monochloropentafluoroethane – Refrigeration
- BCF (halon 1301) bromotrifluoromethane – Fire-fighting, fixed installations
- BTM (halon 1211) bromochlorodifluoromethane – Fire-fighting, fire extinguishers
- halon 2402 – dibromotetrafluoroethane - Portable fire extinguishers

Annexure B:

- CCL₄ – carbon tetrachloride – Solvents, pharmaceuticals, feed stock
- 1,1,1 trichloroethane (methyl chloroform) – Insulation materials, solvents, adhesives

Annexure C:

- HCFCs (40 substances) – Refrigeration, air-conditioning, insulation materials, solvents aerosols
- HBFC-22B1

Annexure D:

List of products containing controlled substances specified in Annexure A.

Annexure E:

- Methyl bromide – Bromomethane – pesticides.

Annexure F

HCFC (40 substances)

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

The Montreal Protocol on Substances that Deplete the Ozone Layer has been very successful in phasing out the production and consumption of some 100 ODSs, which include chlorofluorocarbons (CFCs), HCFCs, halons, methyl bromide, carbon tetrachloride and methyl chloroform. The Montreal Protocol on Substances that Deplete the Ozone Layer controls the phasing out of 100 substances grouped into 5 annexures (A, B, C, E and F) according to their ozone-depleting potential and phase-out dates. The controlled substances are from the following groups of chemicals:

- Chlorofluorocarbons (CFCs)
- Bromofluorocarbons (BCFs)
- Bromochlorofluorocarbons
- Hydrochlorofluorocarbons (HCFCs)
- Methyl bromide
- Carbon tetrachloride
- Trichloroethane

HCFCs, such as HCFC-22, which is widely used in the refrigeration and air-conditioning sector, are thus in the process of being phased out in developing countries by 2030, with a small allowance for servicing thereafter. As a party to the Protocol and its amendments:

It is expected that Eskom Holdings Limited has phased out ODSs according to South Africa's national commitment to the Montreal Protocol and its amendments. Due to a change in staff and procurement processes this appendix will however be left in for one more review cycle to ensure that these requirements are entrenched within the procurement processes and that no further purchasing of ODSs occurs. South Africa is obliged and committed to following the agreed phase-out as follows:

- Freeze consumption and production in 2013 at the baseline consumption (2009-2010);
- Reduce 10% by 2015;
- Reduce 35% by 2020;
- Reduce 67,5% by 2025;
- Allow 2,5% annual consumption during 2030-2040.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

L.1 Environmental impacts

The purpose of this procedure is to provide controlled methods of managing ODSs throughout the organisation. It covers Eskom's requirements for the storage, handling and disposal of all ODSs.

L.2 Management strategies

Under the US Clean Air Act and the Montreal Protocol on Substances that Deplete the Ozone Layer, the United States is phasing out the production and import of HCFCs in order to protect the stratospheric ozone layer. By phasing out the production of ODSs like HCFCs, we are reducing the risk of skin cancer caused by exposure to UV radiation. In addition, many of these ODSs, as well as their substitutes, are greenhouse gases that contribute to climate change.

Eskom must phase out ODSs in accordance with the national commitment for the implementation of the target dates stipulated in the Montreal Protocol (1987) and subsequent amendments.

The Montreal Protocol came into force in 1987. The South African Government signed the 1990 London Amendment to the Montreal Protocol as a developed country. The country was reclassified, on application, as a developing country in 1997.

The final person in the disposal chain (such as a scrap metal recycler or landfill owner) is responsible for ensuring that refrigerant is recovered from equipment before its final disposal.

L.3 Re-classification restrictions:

- South Africa has to undertake to honour all obligations undertaken while still classified as a developed country.
- South Africa cannot ask for financial assistance from the Multilateral Fund of the Montreal Protocol.

L.4 Management requirements

L.4.1 Phase-out dates for controlled ODSs in South Africa

The following phase-out schedule has been accepted:

Annexure/group	Substances	Phase-out dates in South Africa
Annexure C Group 1	HCFC	By 1 January 2040 consumption will be restricted to zero

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

L.4.2 Eskom ODS management

- Business units are required to compile an ODS inventory indicating ODS types, their location and application as well as quantities in storage and use must be maintained, audited and reported annually. This must be reflected through business division performance indicators.
- All precautionary measures practicable must be undertaken to prevent and minimise leakage of controlled substances.
- A phase-out plan, programme and budget must be developed and approved by the relevant Divisional Executives.
- Suitable storage facilities must be provided for the transition phase-out programme. The stockpiling of the ODSs, listed in Appendix A to the Regulations regarding the phasing out and management of ODSs, is prohibited.
- Business units in possession of a stockpile of ODSs listed in Appendix A to the Regulations regarding the phasing out and management of ozone-depleting substance on the date of coming into effect of these regulations must, within 12 months of coming into effect of these Regulations, submit to the Director-General a stockpile abatement plan.
- Contaminated fluids must be stored separately from new fluids for controlled destruction or reclamation.
- No purchases of the new ODS fluids (controlled under Annexure A, B and C Groups 2 and 3) of the Protocol may be permitted. From 1 January 2040, no person is allowed to import, place on the market or use HCFCs.
- Used ODSs and products containing ODSs are collected and moved efficiently to facilities practising approved destruction technologies.
- No trading with ODSs may be allowed. Used ODSs products containing ODSs must be sent to the registered ODS bank holder recovery and recycling.
- The Department of Labour has mandated SAQCC with the responsibility to registering and maintaining data base of “authorised person” for handling and working with gases under pressure.
- To ensure that ODSs and products containing ODSs do not constitute an unnecessary risk, they must be properly packaged and labelled.
- Awareness and technology training programmes on the handling of controlled fluids must be implemented.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

- Purchases of new equipment, materials or processes which utilise ODSs during manufacture or operation may not be permitted where suitable alternatives exist.
- Portable fire extinguishers containing halon must be replaced and the content disposed of through the Halon Bank of SA.
- Conservation of the CFC and HCFC refrigerants, that is, recovery and recycling and leak protection of the equipment and storage facilities must be standard practice.
- A person who imports or exports ODSs listed in Appendix A must, annually, at the end of January every year, report to the Department the total quantities imported or exported for the previous year.
- ODS materials should be stored in specially designated areas, subject to the regulations of the relevant local authorities.
- Discharge or release ODSs into the atmosphere is prohibited.
- A person who reclaims or destroys any ODSs must ensure that the substances are not released into the environment.

Reporting on ODSs must be in line with Appendix K: Waste-reporting requirements as contained in this Standard.

L.4.3 Accountability and responsibility

Divisions and subsidiaries of Eskom Holdings will be accountable for the implementation of plans and programmes to comply with this Standard as required and to provide appropriate reports.

CONTROLLED DISCLOSURE

Appendix M: Silica gel management

Silica gel is used to dry the air as it flows through a bed of silica gel beads in a breather connected to the transformer. The insulating oil of the transformer heats up during operation and it expands into the conservator tank and subsequently pushes the dry air out of the conservator tank through the breather, which is filled with silica gel. When the oil cools down, it retracts and sucks fresh air from the atmosphere through the breather and from this point, the silica gel acts as a dryer for the air that goes back into the conservator tank. Dehydrated silica gel is colourless. When a visible indication of the moisture content of the silica gel is required cobalt chloride is most commonly added. This will cause the gel to be blue when dry and pink when hydrated.

According to the European Commission Directive 98/98/EC (amendment to 67/548/EEC), cobalt chloride has been reclassified as a carcinogen by inhalation. This change is also reflected in South African legislation, where cobalt chloride is now classified as a Hazard Group 2 Carcinogen. Due to the widespread use of cobalt chloride as a moisture indicator in silica gel desiccant, used in transformer breathers, the concern is that this might impact on the health of workers, ground and surface water quality as well as more economically based concerns, such as the use, packaging and disposal of the gel. Silica gel shall be managed in accordance with the Standard for silica gel used in breathers on electrical equipment 240-99072885

M.1 Environmental impacts

Silica gel is non-toxic, non-flammable and non-reactive and stable with ordinary usage, but will react with halogens, strong acids, strong bases, and oxidisers. The storage requirements on the SDS must therefore be strictly adhered to.

The silica gel containing either blue cobalt chloride or copper chloride have some noxious consequences on lungs but generally does not cause illness or toxic effect if exposure is limited to occupational level, but exposure may aggravate pre-existing diseases, such as asthma and bronchitis. Crystalline silica dust can cause silicosis. Staff working with silica gel, therefore, must have this task highlighted in their man-job specifications.

When disposed to land or water, the used silica gel containing copper chloride is toxic to aquatic life.

M.2 Management strategies

To preserve the integrity of the silica gels used, the following strategies shall be followed:

- Only silica gel approved by Eskom shall be managed in accordance with the Standard for silica gel used in breathers on electrical equipment (240-99072885) shall be used.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

- Recycling of silica gel is not recommended due to the risk of reducing its effectiveness.
- Silica gel should not be reconditioned.
- Used silica gel shall be disposed of at a hazardous waste site.

M.3 Management requirements

- a) In order to eliminate the safety and environmental risks when any silica gel is handled, the following precautions must be applied:
- b) Personal protective equipment must be worn when handling the silica gel.
- c) Use gloves to prevent skin contact.
- d) Wear safety glasses with side shields.
- e) Use an approved dust respirator for respiratory protection, since dust from the gel may be harmful to the lungs.
- f) Avoid breathing dust or vapour.
- g) Avoid contact with eyes, skin, and clothing.
- h) Keep containers tightly closed.
- i) Store in cool, dry place. Store in a well-ventilated place.
- j) Sieve the silica gel to remove any "powder" that could clog the breather or impair free airflow.
- k) Silica gel contaminated with oil shall be disposed of because it will no longer adsorb moisture. Discoloured gel (brown, grey, black, etc.) indicates contamination and shall be disposed of,
- l) The used silica gel shall be held in a suitable container labelled as used silica gel until a sufficient quantity has accumulated to be collected by an approved hazardous disposal contractor.
- m) Prevent further leakage or spillage if safe to do so. Avoid discharge into drains, watercourses or onto the ground.
- n) Incorrect disposal, spillage on land and in pathways of surface water runoff, or the misuse of the waste material, is prohibited and shall be reported as a spill incident under Environmental Incident Management Procedure (240-133087117) should accidental spillage of the silica gel occur.
- o) Used silica gel should be managed in an appropriate manner and disposed of at approved hazardous waste disposal facilities.
- p) Disposal of used containers, including molecular sieves and desiccants, must be done in accordance with legislative requirements for hazardous waste.

CONTROLLED DISCLOSURE

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

- q) Processing, use or contamination of this product may change the recommended waste management options. The generator of the waste must ensure that the contaminated waste is reclassified before disposal to determine the correct waste management and disposal options for the contaminated waste.
- r) If large quantities of used silica gel are generated or need to accumulate before disposal, use plastic collection containers to store the used material in until it is collected. The large original silica gel containers could be used for storage of such material.
- s) When using these or any other large containers for storage, please adhere to the following procedure:
- the waste is stored in such a manner that no pollution of the environment occurs at any time;
 - the date upon which accumulation begins is clearly marked and visible for inspection on each container;
 - while being stored on site, each container and tank is labelled or marked clearly with the words “Hazardous Waste”;
 - the waste generator fences off the storage area to prevent unauthorised access and erects a weather-proof, durable and clearly legible notice board in official languages at every entrance of the storage area with the words “Hazardous Waste: unauthorised entry prohibited”;
 - the drum is labelled with a yellow hazardous waste sticker as soon as it begins to be used;
 - the drum is not filled to more than 3/4 of its capacity; and
 - the 3/4 full drum is disposed of with the regular hazardous waste pickup.

Appendix N: Waste hierarchy

The Waste Act is structured around the waste management hierarchy. The hierarchy consists of options for waste management during the life cycle of waste, arranged in descending order of priority, namely waste avoidance and reduction, reuse and recycling, recovery and treatment, with disposal as the last resort (Figure 1). All Divisions must apply the waste management hierarchy in making decisions on how to manage waste.

Figure 1: Waste management hierarchy

The foundation of the hierarchy, and the first choice of measures in waste management, is avoidance and reduction. This step aims for goods to be designed in a manner that minimises their waste components. Also, the reduction of the quantity and toxicity of waste generated during the production process is important. The next stage of the hierarchy is reusing waste. Reusing an article removes it from the waste stream for use in a similar or different purpose without changing its form or properties. After reuse comes the recycling of waste, which involves separating articles from the waste stream and processing them as products or raw materials. These first four stages of the waste management hierarchy are the foundation of cradle-to-cradle waste management. This approach seeks to reuse or recycle a product when it reaches the end of its life span. In this way, it becomes inputs for new products and materials. This cycle repeats itself until as small a portion as possible of the original product eventually enters the next level of the waste management hierarchy: recovery. Recovery involves reclaiming particular components or materials, or using the waste as a fuel. As a last resort, waste enters the lowest level of the hierarchy to be treated or disposed of, depending on the safest manner for its final disposal.

CONTROLLED DISCLOSURE

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

Where the quantity of waste cannot be reduced during production, the purpose of implementing the waste management hierarchy is to use waste as a resource and divert these potential resources from landfill. Although landfill is widely considered the most affordable way to manage waste, this view does not take into account factors such as the environmental impacts of landfills, the costs of developing and maintaining additional landfill capacity to accommodate the increasing rate of waste disposal and the cost of closing and remediating the landfill.

N.1 Benefits of recycling

Recycling of waste has the following benefits:

- It reduces the waste stream going to landfill sites, thus saving landfill airspace.
- It creates opportunities for income generation and alleviation of poverty through job creation.
- It helps reduce pollution and conserve natural resources.
- It conserves energy and reduces manufacturing costs.
- It can reduce informal salvaging from landfill sites.
- It contributes to a cleaner, greener and healthier South Africa.
- It builds pride in our environment.
- It reduces costs to local authorities.

N.2 What can be recycled?

The recycling of waste in Eskom is not only limited to the following waste streams. Eskom sites must investigate opportunities to recycle other wastes that they are generating.

CCP (ash and gypsum), metals and oil mentioned above can also be recycled.

- Tins (cold drink and beer cans, food tins, aluminium foil, paint tins and aerosol cans can all be recycled)
- Glass
- Papers
- Plastics
- Tetrapak (Fruit juice and milk containers)
- Electronic waste (e-waste) (computers, cell phones, iPods, iPads and other tablets, gaming consoles)
- Cartridge recycling

Appendix O: Waste classification and management

- The Waste Classification and Management Regulations, GN R 634 of 23 August 2013 require that waste be classified in accordance to SANS 10234 (GHS) within 180 days of generation.
- Waste listed in Annexure 1 of the Waste Classification and Management Regulations, GN R 634 Regulations do not require classification.
- Divisions must familiarise themselves with Annexure 1 of these regulations and check which waste they generate needs to be classified.
- BUs must ensure that mixture of waste do not happen prior to classification, if classification will be performed.
- Waste must be reclassified every five years, or within 30 days of modification to the process or activity that generated the waste, changes in raw materials or other inputs or any other variation of relevant factors.
- If waste was subjected to any form of treatment, it must be classified.
- Divisions must ensure that the SDSs for waste classification are prepared in accordance with SANS 10234.
- Divisions do not have to prepare the SDSs for pre-classified hazardous waste provided they reflect the product the waste originates from and for mixed waste, the details of the specific hazardous waste/s or hazardous chemical/s in the waste.
- SDSs are not required for medical waste and general waste unless it (general waste) was contaminated with hazardous waste.
- All the Divisions generating hazardous waste, except HCRW (medical waste), must be in possession of the SDSs.
- Waste transporters and waste managers are not allowed to accept waste that has not been classified or pre-classified.
- Divisions are not allowed store waste for more than 18 months of generation without it being reused, recycled, recovered, treated and/or disposed of.
- Eskom sites that have waste disposal sites are not allowed to store waste for more than 18 months from the date of receipt from the waste generator.
- Waste must not be mixed or treated where this would reduce the potential for reuse, recycling or recovery or result in treatment that is not controlled and not permanent.
- Waste may be blended or pre-treated to improve the potential for reuse, recycling, recovery or treatment or reduce the risk associated with the management of waste.

- If the Divisions/BUs have classified waste in terms of minimum requirements, or waste for which an alternative classification was approved by the DWA or DEA, prior to these Regulations taking effect, they must be reclassified using SANS 10234 and assessed if the waste is to be disposed to landfill within three years.
- Waste not classified at all must be classified using SANS 10234 and assessed within 18 months.

Appendix P: Contaminated land provisions

- According to NEMWA, “contaminated” means the presence in or under any land, site, buildings or structures of a substance or micro-organism above the concentration that is normally present in or under that land, which substance or micro-organism directly or indirectly affects or may affect the quality of soil or the environment adversely.
- The land contamination provisions provide for ‘high-risk activities,’ which are activities of an organisation that could potentially lead to land contamination.
- If Eskom has a site where high-risk activities have been or are taking place, the site is likely to have contamination.
- High-risk activities include processes involving substances that present a likelihood of harm to health or the environment.
- For Eskom, these include waste disposal sites, oil storage sites, temporary hazardous waste storage facilities, underground fuel storage facilities, ash dams/dumps, coal stock yards and HV yards. Historical incidents at Transmission substations, Distribution depots or Generation sites could be indicators of contaminated land, for example, oil spills from major transformer failure.
- The contaminated land provisions in Part 8 of Chapter 4 of the National Environmental Management: Waste Act, 2008 (NEM: WA) (Act 59 of 2008), came into operation on 2 May 2014.
- The provisions have significant ramifications in that they apply to the contamination of land even if the contamination –
 - occurred before the commencement of NEM:WA;
 - originated on other land;
 - arises or is likely to arise at a different time from the actual activity that caused the contamination; or
 - arises through an act or activity of a person that results in a change to pre-existing contamination.
- The norms and standards for contaminated land stipulate a list of contaminants that need to be checked in order to confirm if land is contaminated.
- The contaminants include among others: chromium III and IV, lead, hydrocarbons and sulphates.
- If the soil screening value of a particular contaminant exceeds the value stipulated in the norms and standards, it means that the land is contaminated.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

- The Soil Screening values indicate the levels according to which contaminated land must be remediated.

P.1 Identification and notification of investigation areas

The contaminated land provisions have a notification duty. They require a land owner who suspects that they own land that is significantly contaminated (with respect to different receptors and land use scenarios) or a person who undertakes an activity that caused the land to be significantly contaminated, to notify the Minister and the MEC of the contamination as soon as that person becomes aware of that contamination. Failure to comply will result in a specific offence in terms of NEMWA and a person convicted is liable for a fine not exceeding R10 million or to imprisonment for no more than 10 years or to both such fine and imprisonment, plus any other penalty or award under the National Environmental Management Act, 1998 (NEMA) (Act 107 of 1998).

The Minister may issue a written notice to a particular person identifying specific land as an investigation area if he/she on reasonable grounds believes that the land is or is likely to be contaminated. An investigation area is a land that is believed to be contaminated or land on which high-risk activities have been or are taking place that are likely to result in land contamination. Once the Minister or the MEC has identified such areas, or the owner of land or the person who undertook the activity has notified the Minister and the MEC of significant contamination, a site assessment may be required and must be submitted to the Minister or the MEC. The findings of the site assessment report will determine whether the investigation area is contaminated or not. The investigation area may be regarded as contaminated even if the findings of a site assessment report do not indicate potential harm to the environment. The legislation does not distinguish between sites that have been decommissioned or sites that are still operational.

Should a site assessment be required, such an assessment must be conducted in accordance with the requirements of the norms and standards for the remediation of contaminated land. These provide for a uniform national approach to determine the contamination status of an investigation area; limiting uncertainties about the most appropriate criteria; provide for a method to apply in the assessment of contaminated land and provide minimum standards for assessing necessary environmental protection measures for remediation activities.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

P.2 Consideration of site assessment reports

Upon receipt of a site assessment report, the Minister or the MEC may decide whether an investigation area is contaminated or not, whether remediation is required or not or whether the risk must be monitored and managed. In cases where the site must be remediated, the landowner or person must appoint an independent person to compile a remediation plan that provides remediation objectives and future land use. Furthermore, the Minister or the MEC may declare a contaminated area as a remediation site and issue a remediation order. A remediation order may impose limitations on the use of the land and provisions may therefore significantly impact the value of land and future land use planning. Should the investigation area not present an immediate risk, measures must be taken to address the monitoring and management of that risk.

P.3 Transfer of remediation sites

The contaminated land provisions have an effect on the alienation of land as no person may transfer contaminated land without informing the person to whom that land is to be transferred that the land is contaminated. In case the site is in the process of remediation, the Minister or the MEC must be notified and conditions that are specified by them must be complied with before such transfer takes place. Liability can be traced back. The Minister must notify the Registrar of Deeds of any land declared as contaminated.

P.4 Contaminated land register

The Minister will keep a National Contaminated Land Register. The register will include details of the land owner or person, site location, types of contaminants and status of contamination. Once the contaminated land has been remediated and the findings demonstrate that the remediation order has been complied with, the competent authority must inform the Minister, who will change the status of the remediation and notify the Registrar of Deeds.

The remediation of contaminated land was removed as a listed activity from Category A of the Waste Management Activities List. This means that a waste management licence is no longer needed for this activity.

P.5 Implementation strategy

- Eskom, in order to determine the presence of contaminated land, must conduct due diligence investigations prior to any property acquisition. The due diligence investigations should determine the condition of the land and the current liabilities and alert a purchaser to possible future obligations.

CONTROLLED DISCLOSURE

When downloaded from the document management system, this document is uncontrolled and the responsibility rests with the user to ensure it is in line with the authorised version on the system.

No part of this document may be reproduced without the expressed consent of the copyright holder, Eskom Holdings SOC Ltd, Reg No 2002/015527/30.

- Implementation of the provision will be in a phased approach:
 - Phase 1 will be a desktop study of all Eskom Divisions operating high-risk activities, initial investigations and a preliminary risk assessment;
 - Phase 2 will be a detailed investigation, testing for site characterisation (doing the soil screening tests to check contaminants in the soil) and risk quantification for certain identified sites; and
 - Phase 3 will be an evaluation of remediation objectives and a proposed remediation plan, supported by control and monitoring measures for the activities.
- Divisions must identify high-risk activities (for example, underground fuel storage facilities, pollution control dams, waste disposal sites, oil storage areas and transformer storage yards) at their sites.
- The Waste CoE will develop a standardised template for the sourcing of above information.
- Based on the above information regarding the site, Eskom will compile an Eskom contaminated land register, including possibly a preliminary site assessment report for certain sites. The Register will be submitted to the authorities.
- The assessment will be done in accordance with the requirements as stipulated in the norms and standards for the remediation of the contaminated land. That is, the soil screening values will be determined to check if the land is contaminated.
- Should any Eskom site qualify as contaminated, a remedial order will be issued and the land will be recorded in the National Contaminated Land Register by the Minister.
- Eskom will be required to develop a remedial plan to remediate the contaminated land.
