1. SCOPE OF WORK

1.1. DESCRIPTION

INTRODUCTION

Rand Water is the largest water utility company in Africa, is based in South Africa and supplies drinking water to the Gauteng province and other areas of the country. It processes and purifies large volumes of water. Rand Water Institute has focus areas for its innovation and R&D activities. One of these priorities is to utilize Circular economy thinking to encompass water treatment residue beneficiation, waste beneficiation, water security and resiliency, and water reuse. Rand Water's situation is unique in that the nature of the raw water, the treatment process used and the significant volumes of water being processed result in the production of a very large mass of WTR. The WTR, created at Zuikerbosch and Vereeniging water treatment works is combined at Zuikerbosch and dried at the nearby facility of Panfontein. This is dried in stages, coming in at c. 1-2% solids, which is increased to 16-20% solids using gravity thickeners, and then sprayed into large earth beds where moisture both percolates and evaporates, leaving 75-100% dry matter. This ongoing process produces about 500-600 tonnes of residue per day (expressed as dry material). Due to the nature of the process (waste streams are combined from 2 different plants plus natural variations) this residue has variable compositions of primarily inorganic and lesser organic constituents. Rand Water is particularly interested in solutions which address circularity, water security and resilience, and water reuse. Rand Water is looking for innovative solutions, which are sustainable and environmentally friendly, to recover chemicals or commodities from the WTR for reuse. The solution must be at a technological maturity 7 (Technology maturity: Late-stage solutions (TRL 7+) that have passed the proof of concept stage, are in the pilot, ready to commercialize or commercialized.

PROJECT AIM

The aim of this project is to investigate the potential recovery of chemicals or valuable materials from the WTR at Rand Water. In the case of potable water treatment plants, the aim is to recover and recycle materials from WTR produced in the coagulation and flocculation step of water treatment. This would benefit Rand Water as it will reduce operational expenditure and reduce potentially environmentally hazardous waste that is discarded in landfill sites/drying beds.

PROJECT DELIVERABLES

Generally, the methods of recovery of material from water treatment residue are acidification, alkalization, ion exchange and membrane separation. A combination of these methods may be used to achieve a higher recovery, however, Rand Water is not interested in exploring ion exchange and membrane technologies.

The project deliverables are as follows;

- 1) Conduct a feasibility study of the recovery of chemicals/commodities from the water treatment residue and their potential reuse in water treatment OR for other uses with a comprehensive market assessment report. The determined solution must prove to have high efficiency and low cost compared to other methods.
- 2) Determine a methodology for the optimum conditions for chemical/commodity recovery from the water treatment residue that reduces environmental waste and additional waste streams (compliance with environmental regulations for type 3 waste is important). The water treatment residue must be handled in accordance with environmental regulations.

- 3) Conduct a detailed economic assessment of the solution indicating the economic feasibility to Rand Water, with a full financial viability report of the proposed solution compared with existing coagulant dosing procedures to determine the cost-benefit.
- 4) Conduct a full environmental impact assessment of the proposed solution that maximizes the value of the waste stream and minimizes the volume of waste generated.
- 5) A technical report detailing the full-scale application of the recovery of commodities/chemicals from the WTR clearly quantifying the operational expenditure (OPEX) for full-scale recovery.
