2. INTRODUCTION AND BACKGROUND

- 2.1 Forestry planning entails valuation of forestry land, forestry support programmes, subdivision and mapping of forestry land, plantation inventory, volume and mass of logs and standing trees, growth modelling and yield tables, growing stock management and yield regulation, annual planning of operations, valuation of timber plantations and financial analysis of forestry projects. Computerised support systems, linked to a database, have become the main source of information for all plantation decision-making, activity planning and reporting. Forestry planning experts use and interpret comprehensive databases, growth models and computer systems for making decisions regarding the management of forest resources.
- 2.2 The Department requires software tailor-made for South African forestry plantation management, measurement and growth modelling techniques that provide for the comprehensive management of the Department's forestry assets. The system should incorporate spatial land use and an alphanumeric database system to manage and maintain the biological asset register. The department seeks to acquire an integrated forestry planning system accessed through well-developed computerised user interfaces that have all the sophisticated built-in algorithms forestry related scientific and mathematical functions. The accuracy of these functions is key to data integrity in determining numerous statistical analyses.
- 2.3 The Department of Forestry, Fisheries and the Environment (DFFE) have a database of a total of 130 746 00 ha of commercial forestry plantations, which comprises of 84 168 54 ha of commercial and 46 577 46 ha of non-commercial forestry areas. These plantations are in six different Regions: KwaZulu-Natal (KZN); Eastern Cape (EC); Limpopo (LP); Mpumalanga (MP) North-West (NW) and the Western Cape (WC) Provinces. The species distribution is mainly Eucalyptus and Pinus species.

3. OBJECTIVES

- 3.1. The objective is to appoint a suitable service provider to provide a forestry management solution.

- 3.1.1. To serve as a central repository for all commercial trees, natural forests, Areas of Special Interest, road categories, open areas, dams, lookout towers, grassland, private property, bare land, riparian zones, infra-structure layers, as well as related attribute data.
- 3.1.2. To provide end users with a systematic way to create, retrieve, update, manage plantation data and generate reports.

4. SCOPE AND EXTENT OF WORK

The suitable service provider will be expected to deliver the following:

- 4.1. The software solution covers but is not limited to the following:

4.1.1. Software as a Service

- The forestry management solution must be available to the Department on a subscription basis.

The system must have Audit Trail Reports for the use of information systems and Information and Communication Technology (ICT) resources to ensure effective security controls and user accountability.

- Audit trail records of all user accounts in the system, including the access rights and privileges granted.
- Audit Trail Reports are linked to the user access account and keep a history of all changes made in the database to improve accountability.
- Function to report the activities of system administrators' activities.
- Ability and flexibility to enhance the system functionality as per the Auditor General's recommendation to reduce risks via a change request process.

4.1.5. Database System Function

The system should be able to store details on growing stock (Commercial tree species, which are pines, wattle and Gum), afforested areas, conservation areas, fire belts, and infrastructure and comprise detailed stand/ compartment information as listed in Table 1.

Table 1: Database Items

4.1.6. Spatial Functionality

- A GIS-based system with a cohesive database combining both spatial and non-spatial data
- Integrated spatial systems for accurate area determination using Geographical Positioning System (GPS) for field data collection methods, data input into GIS with

shapefiles output, which is a commonly used GIS vector data format, visualisation as maps and optimisation for a wide range of forestry-specific features

- Ability to edit plantation maps using the Departments existing mapping software and synchronising the data back to the proposed software
- Disconnected/ offline spatial editing
- Serve as a central repository for the land-use types utilised in our department, such as commercial and natural areas, roads, and infrastructure features.
- Organise data into datasets based on pre-defined geodatabase layers, such as compartments, roads, rivers and contours.
- The proposed software should have built-in spatial analysis, processing and replication functionality using ArcGIS/ ArcPro technology and tools.
- It should have an integrated spatial viewer that can display multi-layered maps and raster images, as well as highlight the wide range of forestry-specific features. These features include area calculations and road or route configuration.
- Should have a Spatial Replica Management Tool with a Feature Classes grid, which includes features such as Checkout, Apply Management unit Identity Filter, Feature class, Versioned, Has Uncompressed Edits.
